LEADING LOCAL GOVERNMENT IT

A CIO-Level
Framework and Field Guide
to Build a High-Performing IT Organization

CCISDA
Special Edition

STEVE MONAGHAN

Local Government CIO | 25 Years | GovTech Top 25

CGCIO | CGEIT | CRISC | CISA

A NOTE FOR CCISDA MEMBERS

You are reading this because CCISDA arranged it for you, at no cost. I was glad to do it. Special thanks to Tami Weigle and Jarrett Thiessen for coordinating.

CCISDA and I go back a long way. I joined CCISDA in 2000 during my first year as a CA county CIO. I spent 5 years on the CCISDA board of directors and created the CCISDA/CSAC Technology Executive Credential program. Over the years, CCISDA has given me so much; advice, direction, grounding, and lifelong friendships. This group holds a special place for me.

Local government IT runs on shared knowledge. Counties, cities, and special districts don't compete with each other. We learn from each other. We share with each other. The associations that connect us are the reason this profession has any leadership-development infrastructure at all. That is worth honoring.

So here is the whole book. Read it, use it, share what works with your team. If you want a copy for the shelf, a paperback to mark up, or a Kindle copy for the road, they are on Amazon.

DEDICATION

For the government IT leaders who are going to read this and recognize themselves on the page.

The work is hard. It matters. You are not alone.

PRAISE FOR LEADING LOCAL GOVERNMENT IT

"Steve Monaghan has a rare ability to translate years of public-sector technology leadership into practical guidance that leaders can apply immediately. This book is an invaluable resource for anyone responsible for driving innovation, managing risk, and delivering results in local government."

John Matelski, CIO, National Association of Counties

"This is the book I wish was available when I first became a local government CIO. I was fortunate to have Steve's guidance shape my journey, offering clarity and confidence exactly when I needed it most, and this manual captures that same wisdom, brought to life through stories that make every lesson relatable."

Lee Gerney, Chief Information Officer, Yolo County

"This book should be essential reading for every new or aspiring government CIO. It's packed with insight, highly informative, and surprisingly entertaining, even for grizzled IT veterans."

Len De Groot, IT Director, Calaveras County

"I received an early edition of this book on a trip to Paris and couldn't put it down. The HPG-IT framework is the guide I wish I had both when I started my role as a CIO in the retail private sector and transitioned into government. Steve uses his 25 years of experience in leading local government IT to provide a roadmap of what it takes to be a successful CIO for any customer service-based IT organization, and it should be a must-read for current and aspiring IT leaders everywhere."

Reed M. Johnson, Information Systems Manager, Contra Costa County

"I've known Steve for over 20 years and have always respected his thoughtful approach to technology leadership. This book combines practical frameworks, real-world examples, and actionable guidance that will benefit both emerging and experienced public-sector IT leaders."

Mike Taylor, Deputy County Manager & CIO, Pitt County, NC

"I wish this resource had been available at the start of my career. Steve fills these pages with relatable stories and practical guidance. Every technology leader in local government should read it."

Dan Fruchey, CIO, Sonoma County, CA

ACKNOWLEDGMENTS

A book like this does not come from one person. It comes from twenty-five years of conversations, mistakes, course corrections, and the patience of colleagues willing to think out loud with me about the work.

First, to the peers whose stories appear in this book, anonymized but real. Every scene that opens a section came from somewhere. A conference hallway, a budget meeting, a phone call, a coffee on the way out of a board chamber. The CIO who paused before answering my question about her role. The colleague who said "your job isn't to protect IT from the organization." You know who you are. Your willingness to be candid about what was actually happening in your departments is the reason this book has any practical value. Thank you for trusting me with what was hard.

Second, to the leaders I learned from across more than two decades. The County Executives, City Managers, Department Heads, and elected officials who took time to teach me what they needed from IT and why. The Board members who pushed back on bad ideas and made me defend the good ones. The veteran CIOs who let me ask the same question three different ways until I understood the answer. None of the framework in this book is mine alone. Every piece of it was built from what I was taught.

Third, to the associations that built the community where this work happens. CCISDA, MIX, GMIS, NACo, RCRC, ICMA, and the CSAC Institute for Excellence in County Government. The conversations that mattered most happened in your hallways, your peer groups, your committees, and over your meals. The conferences are not the point. The community is the point. You are the community.

Fourth, to the students I have taught at the CSAC Institute and the rising stars I have mentored. You taught me as much as I taught you. Watching you take ideas and adapt them to your own organizations, your own agencies, your own teams, was the closest thing this work has to a finished product. You are why I wrote this down, and the reason I had to write it down clearly.

Fifth, to my early readers, who told me what was working and what was not, and pushed me to cut what did not earn its place. The book is shorter and sharper because of you.

Finally, to my family, who lived with the project, the early mornings, and the weekends at the keyboard. You made room for this work. Thank you.

Any insight in this book belongs to all of the above. Any error is mine alone.

Steve Monaghan, July 2026

WHY THIS FRAMEWORK EXISTS

The Moment Everything Changed

A CIO from a much larger county pulled me aside at a conference and asked: "How does an organization your size do what you're doing? How do you get so much stuff done?"

At the time, my county had just been awarded first place in the Digital Counties Survey. I'd been recognized as a California Public CIO of the Year. Our team was winning digital government awards. I knew what the outside world didn't: we weren't operating with superior resources or staff compared to other counties our size.

So when that CIO asked, it forced me to reflect deeply about why we were delivering results while many equally capable organizations weren't. And the answer surprised me.

We didn't have more money. We didn't have more staff. I wasn't smarter or more innovative than my peers. Our team wasn't materially different from the IT professionals at other agencies doing equally good work.

What was different? After years of reflection and conversations with CIOs across the country, I realized we had something many organizations didn't: a leadership framework in place. Not perfection in any one area. In fact, we had gaps everywhere. But we covered the major areas that actually mattered. We had alignment and balance.

That realization led to the creation of the High-Performing Government IT (HPG-IT) Framework. This book is the culmination of that work, a practical guide for IT leaders who want to build exceptional organizations without burning out in the process.

The Pressure Has Grown

When that colleague asked his question, the demands on government IT were already heavy. They have only grown since. Residents now judge their county or city by the same standard they apply to everything else in their lives. They want to renew a permit, pay a bill, or get a straight answer the way they do their banking, at any hour, from a phone. The patience for anything slower is gone.

At the same time, the work underneath has gotten harder. The threats are constant. The cost of getting security wrong keeps climbing. Artificial intelligence is arriving faster than most departments can absorb it. The old systems of record still have to run, many of them older than the staff who maintain them. And the people who hold decades of institutional knowledge are retiring, often with no one trained to replace them.

What hasn't grown is the budget, or the size of the team, or the number of hours in the day. Expectations keep rising. Complexity keeps deepening. The resources stay flat. That's the squeeze every local government IT leader is living in right now, and it's the reason this framework can't wait. The leaders being asked to carry it were trained for a different job. That's where the trouble starts.

The Problem: You Were Promoted for the Wrong Reasons

Let me say something that might sting a bit: your promotion to CIO or senior IT leader was probably based on skills that are only marginally relevant to your new role.

You got here because you were a technical expert. You successfully implemented IT projects. You solved complex technical problems. You had a strong basis in computer science or information systems management. You earned your promotion through technical excellence and a successful track record of delivering solutions.

And the reward for that track record? A role that demands an entirely different set of capabilities.

The uncomfortable truth is that being a CIO is not primarily about being a technical expert. It's about being a technology delivery expert. These are different jobs requiring different capabilities.

As a technical expert, you focused on systems, infrastructure, security, applications, and technical architecture. You solved technical problems. You implemented technical solutions. That's what you were trained to do. That's where you built your confidence and credibility.

As a CIO, you're now responsible for building and operating what amounts to a business within a business. You're running the IT department inside the larger county, city or special district organization. And they don't teach you how to build, mature, and operate a business with an entrepreneurial perspective in your computer science degree program.

Your new job requires:

- Employee and talent development and management
- Stakeholder engagement and alignment
- Strategy development and planning
- Whole-organization operational planning and oversight across the entire IT department
- Political savvy working with executives and elected officials
- Budget management and financial stewardship
- Service portfolio management and "product" development
- Customer relationship management and meeting expectations
- Building organizational culture and structure
- Handling ambiguity and organizational politics

These are the skills that determine your success and your IT department's success. And most new IT leaders have limited or no experience with them.

Where New IT Leaders Fall Short

Many new IT leaders struggle here. Once in that top position, they view their promotion as validation of their technical success and strengths. This leads them down a path of focusing primarily on technical solutions to all the challenges their organization faces.

This is their comfort zone. This is what they know best. This is where they've accumulated wins. This is where they've received accolades and reinforcement.

So they focus on fixing technical IT management issues. Updating infrastructure. Improving security. Training staff in the latest tools and technologies. Implementing new systems. Following best practices frameworks like ITIL or COBIT.

These are all worthy efforts. But they happen at the neglect of the more important aspects: people, processes, stakeholders, governance, structure, culture, and strategic alignment.

Why? Because these activities don't offer quick wins. They're messy. They take time. They can be uncomfortable. And many IT leaders have no previous education, training, or experience working in these areas.

Some don't know what they don't know.

The result? IT departments that are technically competent but organizationally dysfunctional. Systems that work but customers who are frustrated. Infrastructure that's secure but staff who are burned out. Projects that deliver on time but don't solve the problems people care about.

That's the gap that HPG-IT addresses. It lays out a big-picture framework for IT leaders to execute a balanced approach to the IT leadership role, one that honors technical excellence while building organizational health.

The Paralysis of Traditional Frameworks

If you've tried to implement ITIL, COBIT, NIST frameworks, or any of the major IT management frameworks, you know the problem: they're overwhelming.

These frameworks are comprehensive. They're excellent. They're built for large, complex organizations with specialized teams and deep resources. ITIL was developed by the British government. Microsoft Operations Framework (MOF) was designed for large enterprise IT environments. COBIT emerged from enterprise audit and control needs.

If you have multiple deputy CIOs or multiple chiefs reporting directly to you, if your IT department has hundreds of staff and a budget in the tens of millions, then yes, implement these frameworks in their full glory. You have the capacity and complexity that justifies them.

But for the rest of us, and we are the majority, these frameworks create more problems than they solve.

When a mid-sized or smaller local government tries to implement them wholesale, something predictable happens: staff get overwhelmed, initiatives stall, nothing really gets implemented. You end up paralyzed by the complexity. Your team is stuck in survival mode, working frantically in the business with no capacity to work on the business.

This is the fundamental tension: you know you need to improve. You know you need to raise the maturity level of how IT is supported and delivered. You need continuous improvement. But you're already drowning in daily technical tasks that deliver IT services and maintain infrastructure. Where do you find the capacity? How do you balance keeping the lights on with building something better?

Most organizations give up. They accept mediocrity because improvement feels impossible.

Who This Framework Is For

Let me be specific about who needs this approach.

This is for the 90,837 local governments in the United States; the 38,736 general-purpose governments of cities, counties, towns, and townships, and the 52,101 special-purpose local governments. The vast majority of these serve populations well under 500,000 with IT departments of 150 staff members or fewer.

This is for the single CIO in a district, county or city who is juggling relationships with an executive, department heads, elected officials, and a capable IT team. You don't have multiple deputy CIOs. You most likely don't have a Chief Technology Officer separate from the CIO. You may not have business analysts, organizational development specialists, or dedicated customer service staff. You're it.

This is for IT leaders who need help building and running the business of IT service delivery. In private sector companies, you'd have sales, marketing, customer service, operations management, and business development roles. In government IT, you're expected to perform all of these functions with technical staff who were hired to manage systems, not relationships or strategy.

This is for IT departments that are trying to balance technical excellence with organizational health, where every team member, not just leadership, needs to achieve a healthy balance between doing their daily technical tasks and working on continuous improvement projects that raise organizational maturity.

This is for leaders who feel stuck, who know their organization could be better but can't figure out how to break through the paralysis of limited resources, competing priorities, and overwhelming frameworks that promise transformation but deliver frustration.

If you're in a large organization with specialized deputies and deep resources, you probably don't need this approach. You have the capacity to implement full industry frameworks in their full complexity.

But if you're part of the vast majority of local government IT organizations, working with constraints, limited staff, tight budgets, and enormous expectations, then this framework is designed specifically for you.

What HPG-IT Is

The High-Performing Government IT Framework is not another standards-based framework like ITIL, COBIT, or MOF. It's not a compliance checklist. It's not a certification program.

It's a guidance framework, a clear, digestible map of the core functions every IT department needs to build a mature, resilient organization. One that delivers great service, innovates, and attracts and keeps good people.

What makes it different:

It's right-sized for government IT reality. The framework addresses the areas that matter for mid-sized and smaller IT departments. It doesn't try to cover everything. It focuses on what drives results in real-world local government environments.

It's flexible and adaptable. You can implement it in any order you want, based on your priorities, gaps, and what's already working. You're not locked into a rigid structure. You work with what you have and build from there.

It's built on a systems thinking foundation, which means that no single practice, structure, or leadership behavior operates in isolation. If you are unfamiliar with systems thinking, Daniel Kim's Iceberg Model offers a useful mental image: the visible events in any organization, a failed project, a budget shortfall, a staff resignation, are merely the tip of the iceberg. Beneath the surface lie the patterns and trends that produce those events, the organizational structures and processes that drive those patterns, and deepest of all, the mental models and assumptions that shape everything above. The five modules of the HPG-IT framework map to those deeper layers, and that is precisely why you will find persistent cross-referencing throughout the module summaries and action plans.

If a passage on workforce development points you back to organizational culture, or a discussion of vendor strategy connects to governance and leadership posture, that is not repetition for its own sake. It is the framework showing you how the pieces reinforce one another beneath the waterline. This cross-referencing may occasionally feel tedious, but I encourage you to follow those threads rather than skip past them. A high-performing IT organization is not assembled from independent best practices bolted together; it emerges when leadership mindset, organizational health, service delivery, workforce investment, and strategic governance operate as a coherent system. The summaries are designed to make those systemic connections explicit so that you can see where a change in one area will ripple across others, and where neglecting one area will quietly undermine the rest.

It covers the full scope of IT leadership: people, culture, strategy, governance, relationships, communication, and continuous improvement. The things that determine whether you succeed or fail as a leader.

It's realistic and achievable. These aren't aspirational goals for someday when you have more resources. These are practical objectives that any organization can implement, starting now, with the resources you have.

How to Use This Framework

To state your job plainly as an IT leader: it's not to personally solve all your organization's challenges and problems. Your job is to create the IT service organization that can solve them.

That requires building the team, organizational structure, environment, and culture so that your talented staff can do their best work. Because they know what's wrong and how to fix it. They see the inefficiencies, the technical debt, the customer frustrations, the process problems. They have ideas about how to improve.

What they need is a leader who puts in place the framework and structure for them to be successful.

That's what you'll find in these pages.

The framework organizes around five major modules, each covered in detail in subsequent sections:

Module 1: Being a Government IT Leader. This is about defining your purpose and role. Leaders who actively shape their vision, build relationships, and drive strategy become drivers of excellence. Leaders who let it happen to them become firefighters.

Module 2: Building a Healthy Organization. A high-performing IT department starts with organizational health. In practice, you're establishing shared values and vision, building culture, creating clear structure, investing in people, and maintaining honest communication. These aren't soft skills, they're what all other improvements depend on.

Module 3: Working on the Right Stuff. Good governance, strategic planning, portfolio management, and financial stewardship all make sure your organization does the right work, prioritizes ruthlessly, and delivers measurable value. No more churn. No more reactive chaos.

Module 4: Delivering Great Service. Documented policies, right-sized industry framework components, knowledge management, exceptional customer service, and strong business relationships mean your team doesn't just fix problems, you solve them consistently and earn trust.

Module 5: Continuously Improving. Feedback loops, improvement culture, efficient processes, solid performance management, and innovation leadership keep the organization progressing and adapting to real needs.

Each module provides practical guidance, real-world examples, and actionable steps. The goal isn't perfection, it's progress. It's building an organization that's serious about getting better at the things that matter.

The modules are designed to build on each other, but you can also use them independently based on your most pressing needs. The cross-references throughout the book will guide you to related content in other modules when deeper exploration of a topic would be beneficial.

The Cost of Waiting

When IT organizations lack a coherent framework, the problems compound. Planning becomes fragmented. Service delivery slows. Staff stay confused about how their work connects to anything bigger. The best people leave. People lose trust.

And here's the hard part: these problems feel normal after a while. You stop seeing them as solvable.

But when you implement a mature, deliberate framework such as HPG-IT, the transformation is real. Leadership has clarity on priorities. Employees understand their roles and see how they contribute. Culture shifts from reacting to anticipating. People become partners. Innovation becomes possible because you're not in survival mode anymore.

For CIOs, this means you can deliver reliable, value-driven technology services and lead with confidence. The system you put in place supports good outcomes.

A Personal Note

I wrote this book and framework because I've lived the struggle. I've been the technical expert promoted into leadership without all the skills I actually needed. I've felt overwhelmed by massive frameworks that promised transformation but delivered paralysis. I've worked in an organization where everyone was drowning in operational urgency with no capacity for strategic work.

And I've also experienced what happens when all of this works. When you build a structure that aligns people, processes, culture, and strategy. When you create an organization where talented people can do their best work. When you serve your customers effectively while also taking care of your team.

It's possible. It's achievable. And it doesn't require resources you don't have or capabilities you can't develop.

What it requires is deliberate effort. A willingness to work **on** your organization, not just **in** it. A commitment to building something sustainable, not just reacting to the crisis of the day.

These insights didn't emerge in isolation. Over twenty-five years, I've been privileged to serve alongside hundreds of government IT leaders through professional associations that became laboratories for testing these ideas. As an active member of the California County Information Services Directors Association (CCISDA) for twenty-five years, including five years on their board of directors, I developed the CSAC/CCISDA County Technology Executive credential program and taught several hundred IT leaders through this program over the past decade. Through twenty years with MIX, the Metropolitan Information Exchange, the nation's leading CIO association for large cities and counties, including eight years on their board of directors, I witnessed what separated high-performing organizations from those that struggled.

My twelve years with GMIS and twenty-five years actively engaged with city and county associations including NACo, RCRC, ICMA, and CSAC, serving on multiple committees and advisory groups, provided countless opportunities to learn from peers facing similar challenges with limited resources and unlimited expectations. The stories, examples, and peer experiences woven throughout this book come from these conversations, these relationships, and these shared struggles toward excellence. Every "a CIO I know" reference represents real leaders doing real work in communities like yours.

This book is the roadmap. The work is yours to do.

But you don't have to do it alone. Thousands of IT leaders in local government are facing the same challenges you are. Many have found their way through using these principles. You can too.

The question is: are you ready to try something different?

If the answer is yes, then turn the page. Let's build something better together.

HOW TO USE THIS BOOK

This book is designed as a practical playbook, not a theoretical treatise. Each of the five modules can stand alone, allowing you to start where your need is greatest. However, the modules are intentionally sequenced to build upon each other, creating a cohesive approach to IT leadership and organizational development.

Understanding the Modular Structure

Module 1: Being a Government IT Leader addresses the personal leadership competencies that determine your effectiveness as a CIO. You can't build a high-performing organization if you haven't developed yourself as a leader first. This module is the starting point for everything that follows.

Module 2: Building a Healthy Organization builds on your leadership development by showing you how to create the organizational conditions where people can do their best work. The leadership competencies from Module 1 are essential for building the healthy organization described in Module 2.

Module 3: Working on the Right Stuff assumes you have both leadership capability (Module 1) and organizational health (Module 2) in place. Governance, strategy, and portfolio management all depend on those foundations.

Module 4: Delivering Great Service translates your healthy, well-governed organization into consistent service delivery that stakeholders value. The service frameworks here depend on the governance structures established in Module 3 and the organizational health built in Module 2.

Module 5: Continuously Improving integrates everything. It shows how to create feedback loops, embed improvement into culture, and sustain the gains you've made across all previous modules.

Three Ways to Use This Book

Approach 1: Sequential Development (Recommended for new CIOs) Work through the modules in order, completing the self-assessment and action plan for each module before moving to the next. That way, you're building on solid ground.

Approach 2: Targeted Intervention (For experienced leaders addressing specific gaps) Use the self-assessments in Appendix A: The Field Guide to identify your weakest areas, then focus your energy there. Cross-references throughout the text will guide you to related content in other modules that support your targeted work.

Approach 3: Team-Based Implementation (For organizations with leadership teams) Assign different modules to different leaders on your team, then bring the insights together. For example, your operations manager might focus on Module 3 (Working on the Right Stuff) while your HR liaison focuses on Module 2 (Building a Healthy Organization). Regular team discussions integrate the learning.

Special Features to Help Your Implementation

Self-Assessment Tools: Every module includes a structured self-assessment that helps you honestly evaluate where you are and identify specific areas for development. The self-assessments are consolidated in Appendix A: The Field Guide for easy reference.

Action Plans: Each self-assessment is paired with a concrete action plan template that translates insight into implementation steps. You'll find these templates in Appendix A: The Field Guide.

The Field Guide (Appendix A): All working documents, self-assessments, and action plan templates referenced in the book are consolidated in Appendix A for easy reference. Each entry points back to the section or module that introduced it.

Cross-References: Throughout the text, you'll see references to related content in other modules. These connections help you understand how the pieces fit together and guide you to additional resources when you need deeper exploration of a topic.

Real-World Examples: Every concept is illustrated with examples drawn from actual local government IT organizations, including both successes and failures. These stories help you see how the principles apply in practice.

A Note on Scale and Context

This framework is designed for local government IT organizations serving populations under 500,000 with IT departments of 10 to 150 staff. If you're significantly larger or smaller than this range, you'll need to adapt the guidance accordingly:

For very small organizations (fewer than 10 IT staff): Focus on the core principles rather than formal structures. You don't need elaborate governance committees when your entire IT team fits around one table. But you still need the underlying disciplines, clear prioritization, stakeholder engagement, strategic thinking, and continuous improvement.

For larger organizations (more than 150 IT staff): You'll need more formal structures than described here. Consider this book a foundation, then layer in additional complexity appropriate to your scale. You may benefit from more comprehensive frameworks like ITIL or COBIT, using HPG-IT as the primary guidance framework.

Getting Started

Before diving into Module 1, I recommend:

1. **Complete a quick self-assessment across all five modules** (use the assessments in Appendix A: The Field Guide). This gives you a baseline understanding of where you are.
2. **Identify your top 1–2 priority areas** based on your assessment. These are your starting points.
3. **Share your priorities with your leadership team** and get their input. Their perspective on organizational needs may differ from yours.
4. **Commit to working through at least one complete module** over the next 90 days. Ongoing focus beats scattered efforts.
5. **Schedule regular check-ins** with yourself or an accountability partner to review progress and adjust course.

The goal isn't to implement everything perfectly. It's deliberate, ongoing progress on the things that matter most for your organization's success.

Now, let's build your high-performing IT organization.

THE HPG-IT FRAMEWORK

A Guide to the Five Modules

The High-Performing Government IT Framework consists of five interconnected modules that together create a complete approach to IT leadership and organizational development:

How the Modules Connect

Module 1 (Being a Government IT Leader) is the bedrock. The competencies in this module, understanding your purpose, managing your time, knowing yourself, handling politics, and communicating well, are prerequisites for all other work. Developing yourself as a leader comes first.

Module 2 (Building a Healthy Organization) builds directly on Module 1. The leadership competencies you develop enable you to build healthy teams, create compelling vision, design effective structures, develop people, shape culture, and establish strong communications. The leadership competencies from Module 1 make this work possible.

Module 3 (Working on the Right Stuff) assumes you have both leadership capability (Module 1) and a healthy organization (Module 2). Governance requires

political savvy and communication skills from Module 1. Strategic planning requires the vision and structure from Module 2. Portfolio management requires the people capabilities from Module 2. Everything in Module 3 depends on the previous foundations.

Module 4 (Delivering Great Service) translates your healthy, well-governed organization into consistent value delivery. Excellent service depends on clear governance (Module 3), capable people (Module 2), and strong leadership (Module 1).

Module 5 (Continuously Improving) integrates everything into lasting growth. It creates the feedback loops and cultural practices that keep your organization continuing to evolve and adapt long after you've completed your initial implementation of the approach.

Using This Overview

Return to this overview periodically as you work through the modules. It will help you:

- See how your current work connects to the larger framework
- Identify dependencies when planning your implementation
- Understand why certain sequences of work are recommended
- Find related content when you need to explore connections

The modules may be presented sequentially, but organizational development is rarely linear. You'll find yourself working on multiple modules simultaneously, with progress in one area enabling progress in others. That's natural and expected. The framework provides structure while remaining flexible enough to adapt to your specific situation and needs.

MODULE 1

BEING A GOVERNMENT IT LEADER

Introduction to Module 1

A CIO colleague called me and I could hear the frustration in his voice before he even started talking.

"I just came out of my annual review," he said. "The County Executive told me I'm doing a great job keeping systems running and delivering projects. Then he asked: 'But when are you going to start leading?'"

The question stung because he'd been in the role three years. He was working harder than ever. His team was technically excellent. Projects were completing on time. The help desk response times had improved 40%. By every operational metric, IT was performing well.

But his Executive was right. He wasn't leading, he was managing. And there's a real difference.

He'd gotten so focused on technical excellence that he'd neglected organizational health, strategic alignment, and business relationships. His leadership

team was functional but not cohesive. His staff didn't understand how their work connected to organizational mission. Department heads saw IT as a service provider, not a partner. There was no compelling vision, no shared purpose beyond "keep the lights on."

As we talked it through, he asked me the question every IT leader eventually faces: "How do I make the transition from technical manager to organizational leader?"

This module addresses those challenges.

The Transition No One Prepares You For

Your promotion to IT leadership was probably based on skills that are only marginally relevant to your current role.

You earned that promotion through technical excellence. You implemented systems successfully. You solved complex problems. You understood infrastructure, applications, security, and operations. Your track record of technical delivery got you promoted.

And your reward for all of that? A job that requires a completely different skill set.

As a CIO or senior IT leader in local government, technical expertise is table stakes, necessary but not sufficient. What determines your success is your ability to:

- Define your purpose and understand your role in the larger organization
- Prioritize your time on what matters most instead of reacting to urgency
- Know yourself well enough to lead authentically and with impact
- Handle ambiguity, politics, and complex stakeholder relationships
- Communicate clearly and compellingly across wildly different audiences

These are leadership competencies, not technical competencies. Most of us weren't trained in them. We didn't learn them in computer science programs. We didn't develop them managing infrastructure or implementing projects.

We're expected to figure them out on our own. And many leaders never do.

Two Distinct Paths

Over the years, I've observed that IT leaders in local government follow one of two paths.

The first path: reactive management. These leaders respond to whatever comes their way. They prioritize based on the loudest voice or the crisis of the day. They stay buried in operational details because that's where they feel competent. They view customers as people who "don't understand IT." Their good ideas never gain traction. They work constantly but rarely feel like they're making progress.

These leaders become firefighters, constantly busy, rarely effective, eventually burned out.

The second path: intentional leadership. These leaders define their purpose clearly and operate from that purpose. They protect their time ruthlessly to focus on what matters most. They understand their strengths and gaps and build accordingly. They work through organizational politics skillfully. They communicate in ways that create trust and unity.

These leaders become catalysts for organizational excellence. Their teams thrive. Their business partners view IT as a strategic partner. They deliver results without burning out.

The difference isn't intelligence, technical skill, or natural talent. It's intentionality.

One leader intentionally develops leadership capabilities. The other stays focused on technical work because it's comfortable and familiar, never making the transition into real leadership.

What This Module Is About

This module is about making that transition deliberately. It's about developing the core competencies that determine whether you succeed or struggle as an IT leader in local government.

Yes, self-awareness is critical. But this goes further. This is about defining your purpose and role, understanding what leadership requires in your context, and building those capabilities systematically.

The five sections in this module address the core leadership competencies every government IT leader needs:

Section 1.1: Know Your Purpose and Role. Before you can lead well, you must understand why you're in the organization and what success looks like. You're not implementing best practices for their own sake. You're serving organizational mission through technology.

Section 1.2: Prioritize Your Time on What Matters Most. Your time is your most valuable resource. If you're not protecting it and investing it strategically, you'll stay trapped in operational urgency and never build organizational capability.

Section 1.3: Inventory Your Core Leadership Principles and Competencies. Self-awareness isn't optional for leaders. You must understand your strengths, your gaps, your impact on others, and your development needs. This section provides frameworks for building that awareness.

Section 1.4: Handle Ambiguity and Politics Well. Local government is inherently political. Your success depends on working those political realities skillfully while maintaining your integrity. This section shows you how.

Section 1.5: Be a Good Communicator. Communication isn't something you do in addition to leadership, it IS leadership. Your ability to create clarity, build trust, and drive coherence through communication determines your effectiveness.

Each section provides practical frameworks, real examples from similar-sized organizations, and practical guidance. You can read them sequentially or jump to your most pressing need right now.

The Choice Before You

Developing these competencies is hard work. It requires honesty, humility, and ongoing effort.

You could skip this work. Focus on technical excellence. Stay in your comfort zone. Many IT leaders do exactly that. They achieve reasonable operational success while never quite understanding why they're not more effective, why people remain frustrated, why their good ideas never gain traction.

Or you could commit to developing yourself as a leader. To working on your organization, not just in it. To building capabilities that multiply your impact.

The leaders who thrive in local government IT, who build high-performing organizations, deliver real value, and maintain their health and sanity, are the ones who make this choice and commit to it.

They don't wait until they have time. They don't wait until things calm down. They recognize that working on their leadership capability IS their real work.

How These Competencies Support the Broader Framework

The leadership competencies in this module support everything that follows in the HPG-IT Framework:

Module 2: Building a Healthy Organization depends entirely on your leadership capability. Building a healthy leadership team (Section 2.1) requires strong communication skills (Section 1.5). Creating compelling vision (Section 2.2) depends on clarity about your own purpose (Section 1.1). Developing people (Section 2.4) starts with self-awareness about your own development (Section 1.3).

Module 3: Working on the Right Stuff requires the political savvy developed in Section 1.4 and the communication skills from Section 1.5. Governance (Section 3.1) is about managing competing interests, a leadership competency, not a technical one. Strategic planning (Section 3.2) requires time prioritization (Section 1.2) to move from strategy to execution.

Modules 4 and 5 build on this groundwork. Excellent service and continuous improvement both require developed leadership capability and organizational health.

This is why Module 1 comes first. These topics are genuinely challenging, but without this groundwork, everything else becomes exponentially harder.

What's Ahead

The sections that follow aren't theoretical. They're practical guidance based on what works for IT leaders in local governments facing the same constraints, pressures, and challenges you face.

Each section stands alone. Read them in order or jump to the one addressing your most pressing need right now.

But taken together, they provide a structure for developing yourself as a leader. For becoming the kind of leader who shapes their role instead of being shaped by it. For moving from firefighting to real leadership.

This work isn't easy. It demands self-honesty and sustained effort. But it's possible. And it's worth it.

Because the difference between a CIO who's just managing IT and a CIO who's leading an organization? That difference is major.

Not just for you. For your team. For your customers. For the residents your organization serves.

Let's begin.

Section 1.1

Know Your Purpose and Role

I had a conversation with a CIO not long ago that stayed with me. She'd been running her IT department for six years, and she was exhausted, not from the work itself, but from what she called "the constant battle with people who don't understand IT."

Every conversation seemed to end the same way: people asking for things that violated best practices. Security teams pushing back on business requests. Operations teams frustrated by what they saw as unreasonable demands from the organization. Her team was following the rulebook perfectly, implementing frameworks with rigor, documenting everything. By any technical measure, they were doing IT right.

But something was deeply wrong. And she knew it.

When I asked her to describe her role, she talked about implementing ITIL. About compliance and security controls. About best practices and operational excellence. When I asked her to describe *why* those things mattered, she paused. Really paused.

"To serve the organization," she finally said. But it didn't sound like she believed it anymore.

The most frustrated IT leaders are often the ones who've lost sight of their actual purpose. They've confused "how" government IT works with "why" it exists.

The Purity Trap

There's a real danger in IT leadership. It comes from something that looks like virtue: a commitment to best practices, to standards, to doing things the right way. And those things matter. But somewhere in the pursuit of technical purity, some leaders start viewing the organization itself as the problem.

The infrastructure isn't clean enough. The security posture isn't mature enough. The users don't understand the constraints. The executives make uninformed decisions. The budget should be bigger. The staffing should be deeper.

And yes, sometimes all of those things are true. But when a leader chronically complains about the people and the constraints around them rather than working *with* them, that's a sign that something fundamental is misaligned. That leader has subtly shifted their purpose from "serve the organization" to "implement IT systems correctly."

These are not the same thing.

I learned this from a CIO I greatly respect, who shared this turning point from her career. Early on, she took pride in how rigorously her team implemented security controls. They had fantastic documentation. Their change management process was solid. Their disaster recovery procedures were textbook perfect. And her team was miserable, because every request from the business felt like an obstacle to be overcome rather than a problem to be solved.

It took a crisis to snap her out of it. They had a critical system down, and she found herself more focused on whether the emergency change violated their procedures than on whether they could get the business running again. The organization's executive officer pulled her aside afterward and said something that shifted her entire perspective: "Your job isn't to protect IT from the organization. Your job is to enable the organization through IT."

She told me that distinction changed everything for her. And hearing her describe that moment, I realized how many leaders face the same wake-up call, or fail to face it at all.

Rediscovering Your Real Role

Your role as a government IT leader isn't to be the guardian of best practices. It's not to guarantee perfect compliance or flawless operations. Those things are *means*, not *ends*.

Your real role is to understand what the organization needs and figure out how technology can help deliver that.

Your role is to serve citizens through better government. To enable your colleagues to do their jobs effectively. To create systems that are resilient *and* useful. To keep operations running *and* drive innovation. To be responsible with security *and* not paralyze the organization with fear.

It requires something different than technical purity. It requires judgment.

Sometimes that judgment means saying no, really understanding the risks and standing firm. But sometimes it means saying yes in ways that make your technical people uncomfortable, because the business value justifies the controlled risk. Sometimes it means loosening a policy because the world has changed, even though the policy itself is sound.

The leaders I know who've built high-performing organizations have made peace with this tension. They've stopped viewing people who challenge them as obstacles and started viewing them as part of the system they're trying to optimize.

If your customers are chronically frustrated with IT, that's information. It's not evidence that they're wrong. It's not evidence that they don't understand technology. It's evidence that something in how IT is operating isn't meeting their real needs. And that's on you to fix, or at least to understand deeply enough to make an informed call about what *can* and *can't* change.

Clarity Changes Everything

The shift from "I'm here to implement best practices" to "I'm here to enable the organization" sounds subtle. But it changes your daily decision-making.

When a business unit asks for something that does not align with your operating model, the first question becomes "What problem are they trying to solve?" instead of "Why are they violating the process?" Frame it that way and you often find solutions that serve both the business need and the operational discipline you are trying to maintain.

When your team pushes back against a business request, instead of reinforcing the boundary, you ask: "What's the real constraint here, and is it necessary?" You might discover that the constraint is real, maybe it's a genuine security risk or a legitimate operational limit. But you might also discover that it's a habit, or a legacy decision that no longer applies, or a rule that was built for a different era.

The key isn't being flexible about standards. What matters is understanding why standards exist, so you can distinguish between the ones that actually matter and the ones that are just the way things have always been done.

Starting with Yourself

So if you're going to lead effectively, you need to start with an honest inventory: What is your actual purpose here? Not the mission statement version, the real one. What are you trying to accomplish? Who are you serving? What does success look like?

And then the harder question: Are you honoring that purpose, or have you drifted into something else?

If your answer is that you're keeping the lights on and following best practices, that's not wrong. But it's incomplete. The question behind the question is: to what end? Keeping the lights on *so that* what can happen? Following best practices *in service of* what outcome?

Get clear on your purpose, and you'll find that a lot of the frustration starts to dissolve. The constraints become part of the work, not obstacles to it. Your customers become partners, not problems. And your team starts to understand why they're doing what they're doing, which, it turns out, is one of the most powerful things you can offer them.

That's where real leadership begins. And it's not about being more innovative or more technical. It's about knowing exactly why you're in the room and what you're trying to accomplish.

The rest is just execution.

How This Connects to the Broader Framework

Purpose clarity shapes everything you do in the rest of this framework:

Module 2 (Building a Healthy Organization) requires purpose clarity before you can help your organization define its own. Section 2.2 will show you how to translate your personal clarity into organizational vision. But you can't lead that work authentically if you haven't first done the personal work here.

Module 3: Working on the Right Stuff depends on this clarity. When you're establishing governance (Section 3.1) or developing strategy (Section 3.2), you need to be clear about whether you're governing and strategizing to serve the organization's mission or to achieve technical perfection. The difference determines whether your governance structure becomes a value-enabling mechanism or a bureaucratic barrier.

Your clarity about purpose also shapes how you handle the political dimensions discussed later in Section 1.4. When you know your purpose is to serve the organization through technology, not to protect IT from unreasonable demands, you approach business relationships differently. You become a partner rather than a gatekeeper.

Key Takeaways

- Your job is to enable the organization through technology, not to protect technology from the organization
- Technical excellence is a means to serving organizational mission, not an end in itself
- Chronic frustration with stakeholders often signals disconnect between your perceived purpose and your actual purpose
- Clarity about purpose changes how you make daily decisions and interact with stakeholders
- Purpose must be defined by organizational outcomes, not IT activities

Reflection Questions

Take time to honestly answer these questions:

- When you describe your role to others, do you talk about IT activities or organizational outcomes?
- What percentage of your business conversations feel collaborative versus confrontational?
- Can you articulate how your major IT initiatives directly serve specific organizational or citizen outcomes?
- Do you find yourself defending IT decisions more often than exploring their needs?
- How recently have you changed an IT standard or practice because you realized it wasn't serving the organization well?

Your answers to these questions will reveal whether you're operating from clear purpose or have drifted into the purity trap. Be honest with yourself. This awareness is the first step toward realignment.

The working documents for this section are in Appendix A.1.1.

Section 1.2

Prioritize Your Time on What Matters Most

I got an email from a CIO I know. She'd been in role for about eighteen months, and she was reaching out to ask a specific question: "When do I get to lead?"

She explained that her calendar was back-to-back. Vendor meetings, crisis management, budget reviews, infrastructure assessments, security incidents, user complaints escalated from tier 2 support. She was working fifty-plus-hour weeks. And still she felt like she hadn't *done* anything. No strategy had moved forward. No culture initiative had gained traction. No significant relationship had deepened. She was reactive, exhausted, and increasingly questioning whether the CIO role was even sustainable.

When I asked her what percentage of her time was truly strategic, work that moved the organization forward in a real way, she estimated about five percent.

I asked her what percentage she thought it should be.

Long pause. "At least fifty?"

No one's going to protect your time but you. And if you don't protect it, you won't have any left for the work that matters.

The Trap of Daily Responsibilities

The responsibilities that consume your day are not trivial. They are critical to the smooth operation of the organization. As an IT leader, you're managing enterprise infrastructure, security vulnerabilities, budget approvals, procurement processes, staffing requests. There's the constant avalanche of emails, messages, escalations, each seemingly demanding immediate attention.

You attend board meetings, governance discussions, major project reviews, crisis calls. Special projects get assigned by executives. Customer issues bubble up. Each task feels urgent. Each one feels like it cannot wait.

However, when leaders spend all their time on these day-to-day responsibilities, they risk only ever responding to what is in front of them. They become "firefighters", focused on maintaining the status quo, keeping the lights on, solving the immediate problem. And yes, those things are necessary. But if they monopolize your schedule, you lose sight of what's equally, if not more, important: creating a strong organizational culture, nurturing your teams, setting a vision for the future.

There's a difference between working *in* the business and working *on* the business. Most IT leaders get stuck doing both at once, which means doing neither well.

What makes this trap so seductive is that operational work feels productive. A server goes down and you fix it, problem solved. A security vulnerability is discovered and you patch it, risk mitigated. A customer is frustrated and you address their concern, relationship salvaged. The outcomes are visible and immediate.

You can feel yourself getting things done.

Strategic work doesn't offer that immediate gratification. It's messier. It's harder to measure. It requires ongoing focus and energy. At the end of a day spent on strategy and culture, there's often nothing concrete to point to. It's easier, and less stressful, to autopilot through the daily operational tasks and tell yourself you'll get to the important stuff tomorrow.

Except tomorrow comes with its own emergencies. And the day after that.

The Cost of Not Leading

When leaders are stuck in a loop of constant "doing," the cost is real. Without focused leadership effort, organizations stagnate, values erode, communication breaks down, strategic goals get murky. The organization keeps running, but it lacks direction and energy.

The cost cascades beyond the organization to employees. Without effective leadership, staff feel disconnected from the organization's vision. They're unsure of their role in the bigger picture. Morale dips. Team members feel they lack support for their professional growth and development. If your leadership team is consumed with daily operational work, they're all stuck in the same trap. Your entire organization is "working in the business" with no one "working on the business."

The toll on you is real too. The relentless cycle of tasks leads to burnout, stress, and a feeling of being overwhelmed. You start to feel like you're treading water instead of making real progress. That's not just unpleasant, it's unsustainable.

Research by Deloitte suggests that a large majority of professionals report experiencing burnout at their current job, with lack of work-life balance and excessive workload being primary drivers. For IT leaders specifically, the constant pressure of operational demands combined with strategic responsibilities creates what

researchers call "role overload," where the sheer volume of competing demands exceeds available time and energy.

What Deserves Your Time

So if you're going to carve out time for strategic work, what should fill it?

One-on-ones with your team. These aren't check-in meetings or status updates. They're real conversations where you build trust, understand your people's strengths and challenges, and provide real mentorship. When you invest this time, you gain insight into what's working and what's broken. You discover potential before it's wasted on frustration. You become a better leader because you know your people.

Regular one-on-one meetings are one of the highest-impact activities you can invest in. Research consistently shows that employees who have regular one-on-ones with their managers are substantially more engaged and more likely to feel that their work is meaningful.

Focusing on values and culture. Your organization's culture doesn't happen by accident. It flows from your deliberate attention to it. In practice, you're reflecting on the values you want to see, actively recognizing behavior that aligns with those values, and addressing issues when things drift. It means setting the tone through your own actions, not just your words.

Creating and communicating a clear vision. Your role is to articulate a clear direction for the future and inspire your team to work toward it. It takes consistent communication and follow-through. Not a one-time message. Ongoing clarity about where you're headed and why it matters. People need to understand how their work contributes to the bigger picture.

Conducting leadership team meetings with purpose. Don't treat these as formalities or status update sessions. Make them strategic opportunities. Use them to discuss long-term goals, review key metrics, and brainstorm how to overcome obstacles. Use them to get ahead of issues, not just respond to them. If your leadership team is drowning in meetings, that's a sign you need fewer, better meetings, not more.

Setting clear goals and measurements. Progress requires clarity about what you're trying to accomplish and how you'll know when you've accomplished it. Take time to think this through carefully. Involve your team in setting goals. Establish systems to track progress. Check in on metrics regularly. Not micromanagement. Connection.

Developing your team's growth. Think long-term about the maturity and development of your people. Create plans that outline skill-building, career progression, and succession planning. When you invest in your team's growth, you're building organizational resilience. You're not as dependent on any one person. You have bench strength. You have people ready for the next level.

Management by walking around. Get out of your office. Engage with your broader team. Understand their day-to-day realities. Show interest in their work. These informal interactions often provide insights that formal meetings miss. They also show that you care about the work they do.

All-staff meetings for transparency. Regular all-staff meetings build inclusion and connection. Share updates. Celebrate successes. Address issues. Create space for people to ask questions and feel directly connected to leadership. This sends a signal that people matter and that the organization is moving with intention.

Supporting continuous improvement, not doing it yourself. Resist the urge to jump in and personally take on improvement initiatives. Your role is to support others to take ownership. Delegate tasks. Provide guidance. Remove obstacles. But don't do the work yourself. Your leadership team will remain trapped in operational work unless you deliberately model the way out of it.

Creating Boundaries and Saying No

Perhaps the hardest part of reclaiming time for leadership is learning to say no. Not every meeting requires your attendance. Not every escalation needs your personal involvement. Not every project requires your direct participation.

In practice, set clear criteria for what demands your attention and what others can handle. It means declining some meetings. It means pushing back on requests that don't align with strategic priorities. It means trusting team members to make decisions without you.

Block your most productive time on your calendar and protect it fiercely. If you're a morning person, guard those mornings for thinking and strategic work. If you're creative in the afternoon, block that time. Tell your team it's not available for meetings. Treat it like a critical system outage, because it is. You're protecting the most valuable resource you have: your attention.

If you attended every meeting you were invited to, that would be all you did, all day, every day. You have to be disciplined about it. You have to be willing to disappoint people sometimes by saying no.

A Microsoft Work Trends survey found that the average knowledge worker spends more than half their time in meetings, emails, and chat, leaving less than half for actual work. For leaders, this imbalance is often worse. The discipline of saying no isn't about being uncooperative, it's about being strategic with the scarcest resource you have.

The Three Pillars of Leadership Time

As you think about where your time should go, keep three pillars in mind:

Self-awareness. This enables you to understand your strengths, limitations, and the impact you have on others. By developing self-awareness, you make conscious decisions in step with your values and show authenticity that builds trust. It's the core of emotional intelligence and guides you in working through challenges with clarity

and purpose. Self-awareness also helps you recognize when you're spending too much time on low-value work and getting lost in the daily grind.

Team building. This emphasizes your ability to create cohesive, motivated teams aligned with a shared vision. It means building a collaborative environment, nurturing trust, and encouraging open communication. Strong team-building skills allow you to channel your team's collective strengths and drive innovation. This doesn't happen if you're too busy to invest in it.

Self-control. This is your ability to manage emotions and impulses, particularly in high-stress situations. It's critical for maintaining professionalism, showing resilience, and making thoughtful decisions. Self-control helps you remain focused and adaptable. It also helps you prioritize leadership work over busy "responsibility" work, resisting the pull of urgency so you can focus on what's important.

The Compounding Effect

The more strategic time you invest, the better your operational performance often becomes. Because you're building a healthier organization. Because people understand the direction and don't need constant course correction. Because you're investing in systems and processes instead of just responding to symptoms.

It's counterintuitive, but it's true. The CIO who's in survival mode, reacting to every crisis, often has more crises than the CIO who's invested in building organizational health. The CIO who's building relationships tends to have fewer business conflicts. The CIO who's spending time on culture tends to have lower turnover and higher engagement. The leader with a clear vision has teams that know what to do without needing constant guidance.

Being busy does not mean you're being productive or effective. In fact, the opposite is often true.

Starting Where You Are

If you're reading this and your calendar looks like that CIO's, packed with urgency and short on strategy, don't try to flip it overnight. But do pick one thing. One thing that matters most to you right now. One area where you think your personal time would make the biggest difference.

Maybe it's one-on-ones with your direct reports. Maybe it's clarity on organizational values. Maybe it's a quarterly all-staff meeting. Maybe it's blocking time each week to think about strategy instead of reacting to today's fires.

Pick one. Protect it. Ruthlessly.

Test it for a month and see what happens. You might be surprised at what becomes possible when you have time to think, to connect, to lead.

That's the difference between leaders who are managing IT and leaders who are leading. It's not that they're smarter or have fewer crises. It's that they've made a deliberate choice about where their time goes. And they've protected that choice fiercely.

Your organization needs you to do that. Not eventually. Now.

How This Connects to the Broader Framework

Until you reclaim your time for leadership work, nothing else in this framework can happen. Every module that follows assumes you've created the space to lead:

Module 2: Building a Healthy Organization cannot be built without your time investment. Building your leadership team (Section 2.1) requires regular, focused meetings. Creating vision and purpose (Section 2.2) requires time for reflection and communication. Developing capabilities and people (Section 2.4) requires one-on-ones and coaching. Every element of organizational health requires that you protect time for strategic leadership work.

Module 3: Working on the Right Stuff requires time for governance activities (Section 3.1), strategic planning (Section 3.2), and portfolio management. If your calendar is 100% operational, these strategic activities never happen. Governance becomes rubber-stamping. Strategic planning becomes an annual document that sits on a shelf. Portfolio management becomes whoever complains loudest.

Modules 4 and 5 require ongoing leadership attention too. You can't drive service excellence or continuous improvement while trapped in firefighting. Later modules assume you've created the space in your schedule to lead.

Section 1.2 comes early in Module 1 for a reason. Until you reclaim your time for leadership work, you cannot apply anything else in this framework.

Key Takeaways

- No one will protect your time but you. It requires active, ongoing discipline
- Operational work feels productive but strategic work creates lasting value
- Leadership activities (one-on-ones, culture work, vision communication, team development) are not "nice to have", they're how you lead
- The compounding effect means strategic time investment improves operational performance over time
- Start by protecting time for one high-impact leadership activity and build from there

Reflection Questions

Honestly assess your current time allocation:

1. What percentage of your time last week was spent on operational work versus strategic leadership work?
2. When was the last time you had an unhurried, in-depth conversation with each of your direct reports?
3. How much time do you currently block on your calendar specifically for thinking and strategic work?
4. What meetings could you decline or delegate without negatively impacting outcomes?

5. What would change in your organization if you spent 30% of your time on the strategic leadership activities described in this section?

Track your time for one week using these categories: operational/reactive work, strategic leadership work, and low-value activities. The results might surprise you, and motivate you to make different choices.

The working documents for this section are in Appendix A.1.2.

Section 1.3

Inventory Your Core Leadership Principles and Competencies

A colleague of mine went through a 360-degree feedback exercise before a leadership development workshop, one of those standard tools where leaders get anonymous feedback from their teams, peers, and supervisors about their strengths and development areas.

He was a very capable director who'd been leading for fifteen years. When he got his results back, he went very quiet. Later, he shared something revealing: "I've been leading this way for fifteen years. I thought I was good at it. But reading this feedback, I realized I've been blind to how I actually come across. I thought I was being decisive. Turns out people experience me as dismissive. I thought I was being efficient. Turns out people feel rushed and unheard."

He paused. "I don't know if I want to know this."

That moment captures something important about self-awareness in leadership. It's one of the most reliable predictors of executive success. But it's also uncomfortable, complicated, and sometimes painful. And yet, without it, you're flying blind.

Why Self-Awareness Matters

Self-aware leaders are more effective. Research in organizational psychology consistently finds that self-awareness strongly correlates with improved leadership effectiveness ratings and significantly predicts team performance outcomes. Self-aware leaders make better decisions because they understand their blind spots. They build stronger teams because they know how their behavior affects others. They manage conflict better because they recognize their role in creating it. They inspire

more trust because there's coherence between who they believe they are and how they show up.

The catch: most leaders aren't very self-aware.

We all have gaps between how we see ourselves and how others experience us. That's normal. The question is whether we're willing to look at those gaps. Most people aren't. It's easier to believe your own narrative about who you are and why you do what you do. It's harder to hear that the thing you think is a strength, your ability to make quick decisions, is experienced by others as not listening. Or that your focus on excellence is experienced as perfectionism. Or that your directness is experienced as harshness.

For IT leaders specifically, there's an additional layer of complexity. Many of us come from technical backgrounds. We got here because we were good at solving technical problems. We reward precision, logic, and getting things right. We value efficiency. We tend to be skeptical of things we can't measure or quantify. These traits made us effective individual contributors and helped us move into leadership.

But they can also make us blind to the human, relational, cultural dimensions of leading an organization. We can become so focused on what's right that we lose sight of how we're treating people. So focused on efficiency that we fail to create space for connection. So focused on the problem that we miss the person.

The Self-Awareness Paradox

What's interesting: the people who most need self-awareness are often the least likely to seek it out.

Leaders who have high confidence in their own abilities, which often correlates with reaching senior positions, tend to have lower humility about what they don't know. They've been successful doing things their way. They have confirmation bias. They notice the times their approach worked and forget the times it didn't. They interpret feedback through a lens that protects their self-image.

And then there's the position itself. The higher you go, the less honest feedback you get. People are careful around you. They tell you what they think you want to hear. They avoid conflict. The people who might offer you candid perspective, peers who could challenge you, often become competitors. And your team, while they may care about you, has a power dynamic to handle. They're not going to tell you that your leadership approach is flawed because you control their performance reviews.

So the people who reach the CIO level often get the least honest feedback about how they show up. Which is precisely when they need it most.

This is the self-awareness paradox: the people who need it most often have the least access to it.

Organizational psychologist Tasha Eurich, in a 2018 Harvard Business Review article, found that 95% of people think they are self-aware while only 10–15% actually are. For leaders in technical fields, the gap may be even larger, given the career-long emphasis on technical competence over interpersonal skills.

What Gets Measured Gets Managed

But there's another dimension to this. Self-awareness goes beyond personality and interpersonal style. It's also about understanding your core leadership principles and competencies. What do you believe about leadership? What competencies do you think matter most? What are you genuinely good at? What are the areas where you struggle? What's your leadership philosophy, not the one you say in interviews, but the one you operate from?

Most leaders have never done a real inventory of this. They have a vague sense of their strengths. They know there are some things they're not great at. But they haven't sat down and thought through: What are my core principles? What competencies do I need to build or strengthen? What's the gap between where I am and where I need to be?

The reason this matters is simple: what gets measured gets managed. What gets named becomes something you can work on. What remains vague and unexamined just stays the way it is.

I know a CIO who realized through this kind of inventory that she had a strong competency in strategic thinking but a significant gap in business relationship building. She knew relationships mattered intellectually. But until she inventoried her competencies and named it as a gap, she didn't prioritize developing it. Once she did, she got serious about it. She joined community boards. She scheduled coffee meetings with key department heads. She practiced active listening. Within two years, her ability to build and maintain business relationships had transformed from a significant weakness to a genuine strength.

None of that would have happened without first doing the inventory.

The Uncomfortable Truth About Growth

The competencies you most need to develop are often the ones you least want to acknowledge. I've seen this pattern in dozens of leaders.

If you're naturally good at analysis, you might avoid naming communication as a gap. If you're comfortable with authority and decisiveness, you might not want to develop vulnerability and openness. If you've built your career on being the smartest person in the room, you might resist developing the humility required to learn from others.

That's where self-awareness gets really uncomfortable. Because it's not just about understanding yourself. It's about being willing to work on the things that are hardest for you.

The trade-off is real too. Becoming more self-aware means you have to give up some illusions about who you are. You have to accept that things you thought were strengths might have a shadow side. Your decisiveness might also be rigidity. Your attention to detail might also be micromanagement. Your drive for results might also be impatience.

This is the cost of self-awareness: you lose the comfort of your own narrative.

The payoff: you gain the ability to change. You stop being a hostage to your default patterns. You get to choose how you show up instead of just being stuck in who you've always been.

A 2024 meta-analysis in *The Leadership Quarterly* found that leaders who actively work on self-awareness show measurable improvements in emotional intelligence, team trust, and organizational outcomes within 12–18 months. The discomfort of confronting your gaps is temporary; the benefits compound over time.

Building Your Inventory

So how do you do this? It requires a few things:

Honest self-reflection. Sit down and think hard about who you are as a leader. What are your core principles? What do you believe matters most? What are you genuinely good at? Where do you struggle? Not the polished version. The real version.

Start by writing answers to questions like:

- What situations bring out the best in me as a leader?
- What situations trigger my worst tendencies?
- What feedback have I received repeatedly over the years?
- What leadership behaviors do I admire in others that I don't exhibit?
- What do I avoid doing because it's uncomfortable?

External perspective. This is the critical piece. You need input from people who see you, your team, your peers, your supervisor, trusted advisors. A 360-degree feedback process can be valuable. So can informal conversations where you ask someone you trust: "What do you see as my biggest strength? Where do you think I have the most room to grow?" And then listen to the answer without defending yourself.

Consider using validated assessment tools such as:

- Hogan Leadership Assessment (measures personality, values, and potential derailers)
- DiSC Assessment (behavioral styles and communication preferences)
- Emotional Intelligence Appraisal (EQ competencies)
- StrengthsFinder (natural talents and how to use them)

These tools provide structured feedback that's easier to process than open-ended criticism.

Patterns over incidents. One person saying you're difficult doesn't mean much. But if three people independently mention that you tend to move fast without bringing people along, that's a pattern. That's real. That's something to work on. Look for the themes that show up across multiple sources.

Specificity about competencies. Don't just say "I need to work on communication." Name it specifically. Is it about being a more active listener? About

articulating vision more clearly? About having difficult conversations more effectively? The more specific you are, the more practical it becomes.

Key leadership competencies for government IT leaders typically include:

- Strategic thinking and planning
- Stakeholder relationship management
- Political acumen and navigation
- Communication across diverse audiences
- Team development and coaching
- Change management
- Emotional intelligence
- Decision-making under uncertainty
- Conflict resolution
- Budget and resource management

For each competency, honestly rate yourself: Strength, Competent, Developing, or Gap. Focus your development energy on the gaps that matter most for your role.

A development plan. Once you've identified the gaps, create a plan to address them. This might involve formal training. It might involve coaching. It might involve deliberately practicing new behaviors. It might involve reading and learning. But it must be deliberate. You won't grow by accident.

A good development plan includes:

- Specific competencies to develop
- Concrete actions you'll take (courses, coaching, practice opportunities)
- Timelines and milestones
- How you'll measure progress
- Accountability mechanisms (coach, peer group, scheduled self-assessments)

The Pros and Cons of Self-Awareness

Both sides of this are worth acknowledging.

The pros: Self-aware leaders are more effective. They make better decisions because they know their blind spots. They build better teams because they understand their impact on others. They inspire more trust because there's integrity between who they are and how they show up. They adapt more easily because they're not defensive about feedback. They have better relationships, both professional and personal, because they take responsibility for their part in problems. They're happier, actually, because they spend less energy managing their self-image and more energy on things that matter.

Research suggests that leaders high in self-awareness tend to have teams with lower turnover and higher engagement.

The cons: Self-awareness can make you doubt yourself. Once you see your blind spots, you can't unsee them. The imposter syndrome is real, the more self-aware you become, the more you understand what you don't know. It takes energy to work

on your development areas. It can feel like no matter how much you improve, there's always more to work on. And in government especially, there's a culture that sometimes rewards certainty and confidence, not the uncertainty and humility that come with real self-awareness.

There's also the reality that some self-awareness can paralyze you. If you're too focused on how you're perceived, you might become overly cautious. You might overthink decisions. You might lose the confidence you need to lead decisively. There's a balance between self-awareness and self-doubt.

What you're aiming for is what psychologists call "balanced self-awareness", understanding your limitations without letting that knowledge undermine your confidence or decision-making ability.

Where It Comes Together

Leaders who are deeply self-aware tend to find that balance. They understand themselves well enough to know when they're in their strength zone and when they're overextending. They know when they need to push through discomfort and when they need to pull back. They can be both confident and humble. They can be decisive and open to being wrong.

These leaders tend to have longer, more successful careers. They attract better people, because who doesn't want to work for someone visibly trying to grow? And they build healthier organizations, because the culture reflects their self-awareness: the modeling of continuous improvement, of admitting mistakes, of asking for help.

And they're more fun to be around, honestly. There's a relief in working with someone who is comfortable in their own skin, who doesn't need to prove anything, who can laugh at their own flaws, who is curious about who you are because they're interested in themselves.

Starting Your Inventory

If you haven't done a real inventory of your leadership principles and competencies, this is the place to start. Not eventually. Soon.

Find someone you trust, a coach, a mentor, a peer you respect, and ask them to help you do a 360-degree feedback process or even just have a structured conversation about your strengths and development areas. Then sit with it. Really sit with it. Let yourself feel whatever you feel about what you learn.

Don't jump to fixing it immediately. First, just understand it. Understand what's true about how you show up. Understand where your principles are clear and where they're murky. Understand where your competencies are solid and where you have real gaps.

Then, and only then, create a plan to develop yourself.

The real transformation starts there. Not when you have all the answers. But when you're honestly, deeply curious about who you are and willing to work on becoming a better version of that.

That self-awareness? That's the difference between good leaders and great ones. And it's available to anyone willing to do the work of looking honestly at themselves.

Look honestly. That's where leadership growth begins.

How This Connects to the Broader Framework

Every other competency in this module depends on self-awareness. You can't handle politics without knowing your triggers. You can't communicate well without understanding how you come across. Self-awareness connects forward:

Section 1.1 (Know Your Purpose and Role) requires self-awareness to recognize when you've drifted into the "purity trap" of focusing on technical perfection rather than organizational service. Without self-awareness, you can't see that gap.

Section 1.2 (Prioritize Your Time) depends on self-awareness to recognize your patterns around time management. Are you avoiding strategic work because it's uncomfortable? Are you hiding in operational tasks because they feel safer? Self-awareness reveals these patterns.

Section 1.4 (Handle Ambiguity and Politics) requires deep self-awareness about your triggers, your communication style under stress, and how you're perceived by leaders with different priorities. Your political effectiveness depends on understanding your impact.

Section 1.5 (Be a Good Communicator) cannot be developed without self-awareness about how you communicate, how you listen (or don't), and the gap between your intent and your impact.

Module 2 (Building a Healthy Organization) depends on leadership self-awareness. How can you build a healthy leadership team (Section 2.1) if you're unaware of your impact on team dynamics? How can you shape culture (Section 2.5) without understanding your own values and blind spots? Every element of organizational health begins with self-aware leadership.

The entire HPG-IT Framework assumes you're developing increasing self-awareness as you implement it. The frameworks and structures in later modules won't save you from the consequences of low self-awareness. In fact, they'll make them worse.

Key Takeaways

- Self-awareness is one of the strongest predictors of leadership effectiveness, yet only 10–15% of leaders are self-aware
- The self-awareness paradox: senior leaders often get the least honest feedback when they need it most
- Self-awareness requires both internal reflection and external perspective. You can't see yourself clearly alone
- Focus on patterns across multiple sources of feedback, not isolated incidents
- The skills you need most are usually the ones hardest to admit you lack

- Self-awareness is uncomfortable but it's the only path to deliberate growth and change
- Balanced self-awareness means understanding limitations without losing confidence

Reflection Questions

Engage in honest self-reflection:

1. When was the last time you received honest, critical feedback about your leadership? How did you respond?
2. What leadership behaviors do you exhibit when under stress that you wouldn't exhibit otherwise?
3. If you asked your team anonymously "What does the CIO do that undermines their effectiveness?", what would they say?
4. What leadership competency have you been avoiding developing because it's outside your comfort zone?
5. Who in your professional network would tell you hard truths about your blind spots? When will you ask them?

Consider scheduling a formal 360-degree feedback process in the next 60 days. The discomfort you feel reading that suggestion might itself be useful data about your relationship with self-awareness.

The working documents for this section are in Appendix A.1.3.

Section 1.4

Handle Ambiguity and Politics Well

A few years ago, I was sitting in a budget meeting when the conversation shifted abruptly. The county executive, who had been strongly supporting our IT modernization initiative, suddenly pulled back. "We need to pause this. There's too much uncertainty right now."

The initiative was well-planned. The business case was solid. The technical approach was sound. Nothing about the project itself had changed. What had changed was external, a new state mandate, budget pressures across the county, some political shifts in the board.

In that moment, I watched three IT leaders respond very differently.

One got frustrated. He pushed back hard, making the logical case for why the project should continue. He wasn't wrong, exactly. But he missed the point. The decision wasn't really about the project anymore. It was about politics and uncertainty and risk perception.

Another one panicked. He started making calls, trying to build a coalition to force the decision back in his direction. He burned political capital that day and damaged relationships that took months to rebuild.

The third one, a newer IT Manager who had been in her role for only two years, did something different. She paused. She asked questions to understand what was really driving the concern. She acknowledged the legitimate uncertainty. She proposed a modified approach that addressed some of the risk while keeping momentum. And she did it in a way that made the county executive feel heard, not pressured.

The project moved forward. More than that, she maintained trust and political capital.

That difference, between managing ambiguity and politics well versus managing them poorly, is the difference between an IT leader who survives and one who thrives in local government.

The Reality of Being a Single CIO

Something needs to be said directly: if you're a CIO in local government, you're not just an IT leader. You're managing a complex web of relationships and competing interests that would exhaust most people. And your success, and the success of your entire IT department, depends almost entirely on how well you handle this.

Unlike larger organizations where there might be multiple IT leaders or where IT is one of many major departments, in many local governments, the CIO is IT. You're the single point of contact. You're the translator between technology and every other department. You're the person who has to manage relationships with the county executive, the city manager, or the chief administrator. You're the person who has to manage relationships with elected officials, the board members, the council members, whoever governs your organization.

The hard part: those relationships are political to the core.

A new CIO I mentored learned this the hard way. She came from a mid-sized tech company where she'd been a respected IT director. She was technically excellent. She understood IT operations well. She had managed large projects successfully. When she took the CIO role, she assumed her credibility came from being good at IT.

Six months in, she was struggling. She had conflict with the Finance Director over budget processes. A board member had called her boss complaining about her tone in a meeting. The County Executive had expressed concern that IT wasn't in step with organizational priorities. Her team could feel the tension.

When I asked her what was happening, she was genuinely confused. "I'm doing good work," she said. "The projects are on track. The systems are running well. Why is there so much friction?"

Because in local government, being good at IT is table stakes. It's not enough. What determines your success is your ability to manage relationships with senior executives, department heads, and elected officials. To understand what each of them cares about. To translate IT priorities into their language. To manage the political dynamics without compromising your integrity.

That's the competency that most technical leaders never develop. It's also the competency that determines whether you survive and thrive or become a perpetual source of frustration to your organization.

Government IT leaders consistently report that political and stakeholder navigation is among their most challenging responsibilities, often ranking higher than technical challenges, budget constraints, or cybersecurity threats.

Understanding the Politics

Start with a fundamental insight: every single decision in local government is political. Not partisan-political necessarily, but political, meaning it involves competing interests, power dynamics, and constrained resources.

Your job as a CIO is not to pretend this isn't true. Your job is to understand it thoroughly and work it skillfully.

Start by understanding who the key players are and what they care about:

The County Executive or City Manager. This person is typically focused on operational efficiency, budget management, and managing the board or council. They care about IT to the extent that it serves these goals. They're worried about cost overruns, security breaches, and IT being a bottleneck to getting things done. They want IT to be a partner to their agenda, not an obstacle.

Elected Officials (Board Members, Council Members, Supervisors). These people are focused on constituent service, budget concerns, and looking good to their voters. They may have strong opinions about IT, often based on their own experiences or the complaints they hear from constituents. They want responsive government. They're worried about tax dollars being wasted. They want to feel that IT is serving the public.

Department Heads (Finance, Human Resources, Law Enforcement, Public Works, etc.). These people are focused on their own department's mission. They need IT to work reliably so they can do their jobs. They often feel like IT is slow or unresponsive. They have their own budgets and priorities. They compete for resources. They want IT to support their priorities, sometimes at the expense of IT's broader strategy.

Your Direct Leadership Chain. Whoever you report to, whether it's the top Executive, the Finance Director, or an Operations Manager, shapes your operational reality significantly. You need to understand what they're being measured on, what success looks like to them, and how IT fits into their goals.

Each of these groups has legitimate interests. Each has power. Each influences whether your initiatives move forward or stall. Your job is to understand what each of them needs and to figure out how IT can serve those needs while also maintaining IT's strategic integrity.

It's not manipulation. It's not being political in a negative sense. It's understanding your operating environment and being deliberate about how you operate within it.

Building Relationships as Political Foundation

Everything depends on relationships. Full stop.

Something a colleague told me has stuck with me ever since: "I realized after my first year that I'd been so focused on fixing IT that I hadn't really built relationships with the people who control whether my initiatives succeed."

He was right. And he wasn't alone in that realization.

As a CIO, your relationships with key business partners determine your effectiveness. Not your technical competency. Not the quality of your IT strategy. Your relationships.

Be deliberate about building genuine relationships with:

The County Executive or City Manager. This is your primary relationship. This person needs to trust you. They need to believe that you understand their priorities and that IT is serving them. Forget scheduled meetings. Focus on regular touchpoints. Coffee conversations. Lunch meetings. Understanding what keeps them up at night. Showing that you're thinking about their challenges, not just IT's challenges.

One CIO I know has monthly one-on-ones with his County Executive. Not status meetings. Real conversations. "What's on your mind? What's coming? What do you need from IT?" This simple practice has transformed his credibility and effectiveness.

Elected Officials. This is uncomfortable territory for many IT leaders. But it's critical. You need to build relationships with board members and elected officials. Not by being political. By being accessible and responsive. By understanding their concerns. By helping them understand IT in non-technical language.

Another CIO makes a point of attending board meetings regularly and being available for informal conversations before and after. Not lobbying for her agenda. Just being present, answering questions, building relationships. Board members know her. They trust her. When issues come up, she has credibility.

Department Heads. These are your customers and your peers. You need them to see IT as a partner, not an obstacle. Understand their work. Visiting their departments. Asking about their challenges. Showing real interest. Being responsive to their concerns.

The most effective CIO I know has regular coffee meetings with each department head. Not work meetings. Real conversations. This practice takes time. But it pays dividends in responsiveness and political support.

Your Direct Report. Whoever you report to, you need a strong relationship with them. This person is your advocate internally. They need to understand IT. They need to believe in your leadership. They need to feel that you're aligned with their priorities and the broader organizational agenda.

Studies on organizational influence suggest that a substantial share of workplace decisions are shaped by informal relationships and trust rather than formal authority structures. In government, where formal authority is often diffuse, this dynamic is likely even more pronounced.

Understanding the Informal Organization

Government organizations have two structures: the formal one and the informal one.

The formal structure is what's on the org chart. The reporting lines. The official decision-making processes. The policies and procedures.

The informal structure is where real power lives. It's who influences the County Executive. It's which department heads have real clout. It's which board members call the shots. It's historical relationships. It's personal networks. It's who people listen to.

Understanding this informal organization is critical to your success.

A new CIO learned this the hard way. She looked at the org chart and saw that Finance reported to the County Executive. Reasonable assumption: Finance is important. When she wanted to move something related to financial systems, she focused on the Finance Director and CFO.

But the real power on that financial system lived with the County Executive's Chief of Staff, someone who didn't even show up on the IT radar initially. This person had a relationship with the Finance Director going back fifteen years. This person controlled the County Executive's calendar and attention. This person had influence that exceeded any formal position.

By understanding the informal organization, asking questions, listening, paying attention to who influences decisions, the CIO eventually identified this person and built a relationship. That changed everything.

Organizational network analysis shows that informal influencers often have 3–5 times more impact on decision outcomes than their formal titles would suggest. Mapping these informal networks is critical for handling the politics.

Managing Up: The Political Reality of Your Relationship with the Executive

As a CIO, you have a power imbalance relationship with your County Executive or City Manager. They can fire you. They control your budget. They determine whether your initiatives move forward. That's the political dynamic. It's unavoidable.

Managing this relationship well requires several things:

Understand their priorities and make IT serve them. Your job is not to impose IT's priorities on the organization. Your job is to understand the County Executive's priorities and figure out how IT enables them. If they're focused on constituent service, frame IT investments around improving constituent experience. If they're focused on operational efficiency, frame IT around reducing costs or improving process. Same IT initiative. Different framing. The difference is that you're speaking their language.

Be the translator, not the technologist. When you communicate with executive leadership, speak their language. Not technology language. Not "We need to upgrade our infrastructure to move to a cloud-native architecture." Say, "We can improve service reliability for the Finance Department and reduce long-term infrastructure costs by moving to a managed cloud platform. The result is fewer IT

staff required for maintenance and faster implementation of new capabilities." Same thing. Different language.

Build trust through reliability and transparency. Commit to things you can deliver. Deliver them. If something's going to be late or over budget, communicate early and honestly. Don't surprise people. Don't hide problems. The County Executive would much rather hear about a problem early when options exist than discover it after the fact.

Make your County Executive or City Manager look good. This sounds cynical. It's just smart politics. Your executive is being evaluated on whether the organization runs well, whether the board is satisfied, whether constituents are served effectively. If IT is supporting that, your executive looks good. If IT is a problem, your executive looks bad. Align your priorities with making your executive look good, and your executive will support you.

Say no strategically. You can't do everything. At some point, you'll be asked to do something that's either impossible, inadvisable, or misaligned with strategy. How you handle this determines your credibility. You don't say, "No, that violates IT best practices." You say, "Here's what we can do within our current resource constraints. Here's what we'd need to do the other thing. Here's my recommendation based on organizational priorities. What would you like to do?" You're giving your executive a choice. You're providing the information they need to make it. You're not being rigid. You're being professional.

Managing Across: Building Credibility with Department Heads and Elected Officials

As a CIO, you're managing a complex web of relationships with people who have competing interests and different levels of understanding about IT.

With Department Heads: These are your peers. They're running their own departments. They have their own budgets and priorities. They compete with IT for organizational resources. Your job is to build partnerships with them. Understand their work. Be responsive to their needs. Help them understand IT constraints realistically. Build trust so that when you have to say no or when you need to prioritize other departments, they understand it's not personal.

A city CIO makes a point of having quarterly strategic conversations with each department head. "What's working well in our relationship? What could be better? What are your challenges ahead? How can IT help?" This practice builds understanding and brings coherence.

With Elected Officials: This is where many IT leaders feel most uncomfortable. But elected officials are key partners. They're interested in whether government is working well, whether services are delivered effectively, whether tax dollars are being used wisely. You can talk to them about these things in non-technical language.

A special district CIO does an annual IT presentation to the board. Not a technical deep dive. A conversation about what IT is doing to support the district's mission. How IT is improving constituent service. How IT investments are being managed responsibly. The board members appreciate the transparency and access.

Experience and research suggest that CIOs who maintain regular communication with elected officials are more likely to secure budget approvals and to have their strategic initiatives supported.

Working Through Conflict and Competing Interests

Ambiguity and competing interests create conflict. It's inevitable. The question is how you handle it.

Many technical leaders either avoid conflict or approach it too directly. Avoiding conflict means issues don't get resolved and resentment builds. Being too direct or defensive can escalate situations unnecessarily and damage relationships you need.

Diplomatic conflict resolution is a middle path:

Address issues directly but respectfully. Don't let problems fester. But address them in a way that preserves relationships.

Seek to understand before advocating. Ask questions. Understand the other person's perspective and what's driving their concern. Often, the surface conflict masks a deeper issue.

Look for solutions that address underlying interests, not just surface positions. A Department Head wants more IT staff. That's the position. But the underlying interest might be faster response time or better support for their specific needs. There might be solutions other than hiring more staff.

Be willing to compromise when appropriate. You won't win every battle. You don't need to. Compromise on some things and maintain credibility for holding firm on others.

Maintain the relationship even when you disagree. This is critical. You might lose a specific conflict but need that relationship for the next issue. The person you're in conflict with today might be your ally tomorrow on a different issue.

The conflict started over IT budget allocation. The Finance Director wanted tight controls. The CIO wanted more flexibility. Rather than each digging in, they had a conversation about what the Finance Director was trying to accomplish (fiscal responsibility and predictability) and what the CIO needed (ability to respond to changing priorities). They found a middle path: tighter controls on routine spending but a contingency fund for unexpected needs. Both parties got what they needed.

The Harvard Program on Negotiation emphasizes that interest-based negotiation (focusing on underlying needs rather than stated positions) resolves conflicts far more constructively than positional bargaining. (This approach is particularly effective in government settings where ongoing relationships matter more than winning individual disputes.)

Embracing Ambiguity and Uncertainty

Government operates with uncertainty. Budget can change mid-year. Political winds shift. State mandates change direction. New crises emerge. Plans get disrupted. This is the environment you're operating in.

As a CIO, you need to help your organization manage this uncertainty without becoming paralyzed by it.

This starts with your own mindset. Do you see ambiguity as something to be eliminated, or as a condition to be managed? If you frame ambiguity as a problem to solve, you'll be perpetually frustrated. If you frame it as the reality you're working in, you can build systems and approaches to handle it.

Scenario planning. Instead of creating one detailed plan, create several scenarios. "If budget stays flat, here's what we do. If we lose 15% of budget, here's the alternative approach. If we get an unexpected technology mandate, here's how we respond." This doesn't predict the future. But it prepares your organization to respond quickly when change happens.

Organizations that engage in regular scenario planning are significantly more likely to handle disruptions successfully and maintain stakeholder confidence during uncertainty. The practice creates psychological readiness for change.

Communication in uncertain times. When ambiguity is high, people need regular communication about what you know, what you don't know, and what you're doing about the things you don't know. They need to understand the thinking behind decisions. They need to feel that leadership is thinking about uncertainty, not pretending it doesn't exist.

One approach that works well for a CIO: quarterly "state of IT" meetings with department heads and leadership. "Here's what we're confident about. Here's what we're monitoring. Here's what we're planning for. Here's how you can help shape our direction." The CIO doesn't pretend to have all the answers. She invites people into the problem-solving.

Building flexibility into culture. When people know that conditions might change and that's okay, they're less resistant to change. When you model flexibility, "We thought this would work this way, but conditions have changed, so we're adjusting", people don't experience that as failure. They experience it as leadership adapting to reality.

Building Political Capital

Think of political capital as a currency. You earn it through competence, reliability, and integrity, and through the relationships you've built. You spend it when you need something, when you need to push a priority, when you need support, when you need to make a difficult decision.

New CIOs often make the mistake of trying to spend capital they haven't earned yet. They arrive with big ideas about transformation. They want to push change quickly. They haven't built sufficient credibility or relationships yet. When they push hard, they burn bridges.

Better approach: spend your first-year building capital. Deliver on commitments. Build relationships. Show that you understand the organization's priorities. Show competence and reliability. Then, once you've built credibility, you can push harder on strategic priorities. You have capital to spend.

One CIO told me, "My first year, I said yes to everything and exceeded expectations. My second year, I had enough credibility to start saying no strategically and proposing my own agenda. By year three, people were supporting my initiatives because they trusted me and had seen that I deliver."

This aligns with what we know about trust-building in organizations: competence must be demonstrated before influence can be exercised. Leaders need approximately 9–12 months of consistent performance before stakeholders grant them discretionary authority for strategic changes.

Ways to build political capital:

- Deliver quick wins that people care about
- Be visible and accessible, attend meetings, show up at events
- Give credit generously to others
- Admit mistakes quickly and take responsibility
- Share information early
- Support others' initiatives when you can
- Show understanding of organizational politics without playing games
- Show up consistently, reliability builds trust over time

Ways to spend political capital:

- Pushing a controversial but necessary initiative
- Saying no to a powerful executive's request
- Making a decision that benefits the enterprise but disadvantages one department
- Implementing a change that creates short-term disruption for long-term benefit
- Advocating for budget or resources

Build more capital than you spend, creating a reserve for when you really need it.

The Board's Fiduciary Responsibility: Your Political Shield

Many CIOs miss this: elected officials have fiduciary responsibilities and legal obligations. They're not being difficult when they ask tough questions or push back on recommendations.

Board members owe the public duties of care, loyalty, impartiality, accountability, and the duty to preserve public trust. This means they're legally and ethically obligated so that IT investments are sound, necessary, and properly vetted.

When you frame your work in terms of fulfilling these fiduciary duties, you shift the political dynamic. You're not asking board members to trust your technical judgment, you're providing them the due diligence mechanism they need to fulfill their responsibilities.

Here's why governance is so powerful politically. It creates a systematic process where board members can show they've exercised appropriate oversight. When a controversial IT decision needs to be made, you can point to the governance process: "This has been reviewed by the IT Governance Working Group, vetted by department stakeholders, evaluated for risk, and recommended by the Strategic Council. Here's the documented due diligence."

That documented process protects board members politically. They can show constituents that decisions weren't arbitrary, that they followed a systematic, stakeholder-driven process. When you reduce their political risk like that, they're far more willing to back your initiatives.

Smart CIOs frame IT decisions in terms of board oversight responsibilities:

- "This investment aligns with the strategic priorities you approved in the county strategic plan"
- "The governance process makes sure you're exercising appropriate due diligence"
- "This approach balances the innovation you've directed with appropriate risk management"
- "The multi-year roadmap provides the transparency you need for budget planning"

When board members understand that your processes help them fulfill their responsibilities, you become an enabler rather than a supplicant.

Working With Different Leadership Styles

Different executives and elected officials have different leadership and decision-making styles. Your political effectiveness depends on adapting to these styles, not expecting everyone to adapt to yours.

The Analytical Leader wants data, analysis, multiple options with pros/cons. They make decisions slowly and deliberately. Give them written materials in advance. Present structured analysis. Be patient with their process.

The Decisive Leader wants bottom-line recommendations, not endless options. They make quick decisions and expect you to execute. Be concise. Come with your recommendation. Be ready to move fast.

The Collaborative Leader wants input from multiple people before deciding. They value process and inclusion. Bring people along. Show that you've consulted. Give them a collaborative decision-making process.

The Intuitive Leader trusts their gut and wants to understand the "feel" of something. Data matters but so does narrative. Tell stories. Help them visualize outcomes. Appeal to both logic and intuition.

The Political Leader is primarily concerned with how decisions play politically, with constituents, with the board, with other power players. Help them understand political implications. Show how you've considered different perspectives. Reduce their political risk.

Most executives combine elements of several styles. Your job is to observe, understand, and adapt. One CIO keeps notes on each board member's style and decision-making patterns. Before major presentations, she reviews those notes and tailors her approach to what works for each person.

This isn't manipulation, it's communication competence. You have important information to convey. Adapting your approach to how people receive information makes you more effective.

Warning Signs You're Failing Politically

Pay attention to these signals that your political navigation needs work:

- **Your initiatives consistently stall in approval processes.** If governance or budget requests routinely get delayed or tabled, people aren't bought in.
- **You're surprised by decisions that affect IT.** If you're learning about major organizational changes after they're decided, you're not in the right conversations.
- **Stakeholders go around you.** If departments are getting IT services from external vendors without consulting you, they don't see you as a valuable partner.
- **Your team reports tension with customers.** If your staff regularly describes business relationships as adversarial, that's reflecting your political approach.
- **Board members ask questions you can't answer.** If you're regularly caught off-guard in board meetings, you haven't done enough relationship-building or prep work.
- **The County Executive seems frustrated with you.** If your boss is expressing concern about "alignment" or "strategic fit," they're trying to tell you something important.
- **You have no allies when you need them.** If you can't name three department heads who would actively support your initiatives, you haven't built sufficient relationships.

Don't ignore these signals. They're telling you that political navigation needs immediate attention.

The Political Imperative

As a CIO in local government, your success depends on your ability to handle politics and ambiguity well. You're not abandoning technical excellence. You're adding a layer: understanding that technical excellence alone isn't enough.

You need to build genuine relationships with your County/City/District Executive, department heads, and elected officials. You need to understand the formal and informal power structures in your organization. You need to be able to influence without authority. You need to handle conflict diplomatically. You need to communicate in language that lands with different audiences. You need to manage ambiguity without paralysis.

Most of all, you need to understand that your job goes beyond running IT. Your job is to be a partner to your organization's mission, to use IT strategically to advance what the organization is trying to accomplish.

When political skill and relationship-building click, everything else follows. Your initiatives move forward. Your team is engaged. Your leadership is supportive. Your organization gets value from IT.

When you ignore this, when you focus purely on technical excellence and ignore politics and relationships, you'll struggle perpetually. You'll wonder why good ideas don't move forward. You'll feel frustrated and undervalued. You'll experience high turnover in your team because they feel the dysfunction.

The choice is yours. But the skill is learnable. It takes deliberate work. It takes humility. It takes understanding that political savvy isn't corruption, it's professionalism.

Develop this competency. Everything else in the role depends on it.

How This Connects to the Broader Framework

Political navigation isn't a standalone skill, it touches every other area of the HPG-IT Framework:

Section 1.1 (Know Your Purpose and Role) grounds your political navigation. When you're clear that your purpose is to serve the organization's mission, political navigation becomes about enabling that mission rather than protecting IT's interests. Without that clarity, political navigation can become self-serving.

Section 1.2 (Prioritize Your Time) requires that you invest time in relationship-building with key business partners. The relationships described in this section don't happen by accident, they require the dedicated time carved out in Section 1.2.

Section 1.3 (Self-Awareness) is essential for political effectiveness. You need to understand how you're perceived by different partners, what triggers defensive behavior in you, and how your communication style lands with various audiences. Without self-awareness, you can't adapt.

Section 1.5 (Be a Good Communicator) provides the specific skills for the relationship-building and relationship management described here. Political navigation is communication work, understanding what different people care about and translating IT priorities into their language.

Module 2: Building a Healthy Organization depends on political capital. You cannot build a healthy organization without support from executives and

business partners. The governance work in Module 2, Section 2.1, requires political navigation skills to manage the competing interests within your leadership team.

Module 3: Working on the Right Stuff is entirely about political navigation. IT Governance (Section 3.1) is a political process, balancing competing priorities, managing stakeholder interests, securing executive and board support. Strategic planning (Section 3.2) requires understanding the politics so that your strategy is realistic and achievable.

Political navigation isn't optional for IT leaders; it's the air you breathe in local government. Handle it well, and you create space for the rest of your agenda. Neglect it, and even your best technical work won't land.

Key Takeaways

- Local government is inherently political; your success depends on working within this reality skillfully
- Relationships with executives, department heads, and elected officials determine your effectiveness more than technical competence
- Political capital is earned through competence and relationships, spent when pushing strategic priorities
- Understanding the informal organization is as important as understanding the formal structure
- Conflict is inevitable; diplomatic resolution preserves relationships while addressing underlying interests
- Ambiguity and uncertainty are permanent conditions requiring scenario planning and transparent communication
- Board members' fiduciary responsibilities can be your political shield when used well
- Different people have different styles; adapt your approach rather than expecting them to adapt to yours

Reflection Questions

Assess your political navigation capabilities:

1. Can you name the three most influential people in your organization (formal or informal)? What have you done to build relationships with them?
2. When was the last time you had a conversation with an elected official that wasn't about a specific IT issue?
3. How much time do you currently invest in relationship-building with key business partners versus technical work?
4. Think of your last major initiative that stalled. What political dynamics did you miss?
5. Who are your allies? Who could you call right now for support on a controversial decision?

6. What percentage of conflicts in your organization get resolved constructively versus leaving relationship damage?
7. When faced with ambiguity, do you try to eliminate it (control mindset) or manage it (adaptive mindset)?

The working documents for this section are in Appendix A.1.4.

Section 1.5

Be a Good Communicator

A CIO I know had one of her senior managers knock on her door one afternoon. The manager looked frustrated.

"Can I ask you something?" she said. "What's our priority right now? Because I'm getting conflicting signals. You said customer service improvement was critical. But we're being pushed to finish the infrastructure project. And meanwhile, half my team thinks security is the most important thing. Everyone's working hard, but we're not aligned."

The CIO realized in that moment she had a communication problem. Not because she wasn't communicating, she was constantly sending emails, holding meetings, giving updates. The problem was that her communication wasn't landing. People weren't hearing what she thought she was saying. And the result was confusion, misalignment, and wasted effort.

That conversation changed how she thinks about communication in IT leadership. Your success as an IT leader rests on good communication. Not just adequate communication. Not just frequent communication. Good communication, the kind that creates clarity, builds trust, drives vision, shapes culture, and creates real engagement.

This applies to every level. Your relationship with the county executive or city manager. Your credibility with the board. Your relationship with department heads and business partners. Your team's engagement and performance. All of it depends on how well you communicate.

And yet, communication is often the most underdeveloped competency in technical leaders. We focus on technical skills, project management, operational excellence. But we don't invest nearly enough time thinking about how to communicate across different audiences and contexts.

It's a problem. Because in local government, where you're the CIO working through complex relationships with executives, elected officials, department heads, and your own team, communication is everything.

Why Technical Leaders Struggle with Communication

Let me name something that's uncomfortable but true: many people who go into IT are not naturally strong communicators.

We're drawn to technology because it's logical. It's predictable. It follows rules. You can solve problems through analysis and precision. The computer doesn't care about your tone of voice or your body language. It cares about whether your code works.

There's comfort in that. It's why many of us chose this field.

But leadership is different. Leadership is about people. And people are not logical or predictable. They respond to emotion, context, relationship, and trust as much as they respond to facts and logic.

A technically accurate message can still land wrong. A brilliant strategy can die if people don't understand it. And a perfectly reasonable decision? It can create real resentment if you deliver it without empathy or context.

That gap hits many technical leaders hard. We're trained to value precision and efficiency. We want to get to the point. We assume that if the information is correct, people will understand and align.

But communication doesn't work that way. Especially in local government, where you're managing relationships across wildly different audiences, each with their own priorities, concerns, and ways of processing information.

Technical experts transitioning to leadership roles struggle most with what researchers call "contextual communication", the ability to adapt message, style, and approach based on audience needs rather than sender preferences.

The Hierarchy of Communication Needs

I've developed what I call the "Hierarchy of Communication Needs", similar to Maslow's Hierarchy of Needs, but for how people experience communication in organizations.

Picture a pyramid. At the top, the most important, most meaningful form of communication, are one-on-one conversations. As you move down the pyramid, the communication becomes less personal and, therefore, less meaningful to the individual receiving it.

The hierarchy looks like this:

Level 1 (Top of Pyramid): One-on-One Conversations This is the most powerful form of communication. Direct, personal, tailored to the individual. This is where trust is built. Where people feel heard. Where you can address specific concerns, provide personalized feedback, and create real connection.

Level 2: Small Team Meetings (Your Direct Reports) Still personal, but shared with a small group. Your leadership team builds alignment, works through challenges together, and creates cohesion. People feel included in the inner circle.

Level 3: Department Meetings (Your Whole IT Team) Broader, less personal, but still allows for some interaction and dialogue. People see themselves as part of the larger team. They hear directly from leadership. There's opportunity for questions and feedback.

Level 4: Agency-Wide Meetings (All-Staff or Cross-Departmental) Much broader. Less personal. More formal. People get information but may not feel individually connected to it. Still valuable for transparency and creating shared understanding across the organization.

Level 5: Written Communications (Emails, Newsletters, Memos) Bottom of the pyramid. Least personal. Most easily ignored or misinterpreted. Information is broadcast, but there's no dialogue, no opportunity to read body language or tone, no chance to adjust based on reaction.

Most leaders spend most of their communication time at the bottom of the pyramid. Emails. Newsletters. All-staff memos. These are the easiest, most efficient ways to communicate. You write something once and send it to everyone.

But they're also the least effective. Because people don't engage with information that doesn't feel personal to them. They don't feel connected to messages that could have been sent to anyone. They don't trust communication that's one-way and impersonal.

The higher up the pyramid you go, the more personal and direct your communication, the more impact it has. One-on-one conversations take more time. But they create exponentially more trust, clarity, and engagement than any amount of email ever will.

This is the trade-off every leader has to manage: efficiency versus effectiveness. And most leaders optimize for the wrong thing.

Research consistently shows that employees rate one-on-one conversations as far more effective for building trust and clarifying expectations than email communication, yet leaders spend the majority of their communication time on email rather than in direct conversation.

One-on-Ones: The Core of Everything

If you take nothing else from this section, take this: regular, structured one-on-one conversations with your direct reports are the single most important communication practice you can establish.

Not status meetings. Not project updates. Real one-on-ones where you create space for open dialogue, feedback, and connection.

Effective one-on-ones look like this:

They're scheduled and protected. Not "let's catch up when we get a chance." A specific time on the calendar. Weekly or bi-weekly. Protected from interruptions. This signals that the person matters and that their time with you is a priority.

They're employee-led, not manager-led. You're not there to give a download of information or get status updates. You're there to listen. To understand what's on their mind. To address their concerns. To remove obstacles. To provide guidance. The agenda is theirs.

These meetings are where you build relationship. People need to feel they can be honest with you. That they can raise concerns without being judged. That they can admit struggles without it being held against them. If your one-on-ones feel like performance evaluations, people will be guarded. If they feel like real conversations, people will open up.

Not just work relationship. Real relationship. You learn about people's lives, their aspirations, their challenges outside of work. You show that you care about them as people, not just as employees. Trust is built here.

They're where you provide mentorship and development. You're not just managing tasks. You're developing leaders. You're helping people grow. You're investing in their future. The one-on-one is where that work happens.

"My one-on-ones are the most important meetings on my calendar." That's what a colleague I greatly respect told me. Her one-on-ones with her direct reports are non-negotiable. If she has to cancel other meetings to protect that time, she does. Because she knows that those conversations are what keeps her team aligned, engaged, and performing at a high level.

When I asked her what changed when she started doing this consistently, she said: "Everything. People feel heard. They trust me. They're more willing to raise problems early. They're more engaged in solving organizational challenges. And honestly, I understand what's actually happening in my organization instead of getting filtered information through status reports."

One-on-ones have that kind of impact. They're not just nice to have. They're central to your effectiveness as a leader.

Communicating to Different Audiences

As a CIO in local government, you're not just communicating with your team. You're communicating with multiple, very different audiences, each requiring a different approach.

With the County Executive or City Manager: This person cares about operational efficiency, budget, risk, and whether IT is supporting the organization's strategic priorities. They don't need technical detail. They need to understand: What's the business impact? What's the cost? What's the risk? What's the timeline? What do you need from me?

Your communication needs to be concise, strategic, and focused on organizational outcomes. Tell stories that connect IT work to what the organization actually cares about. Frame issues as business impact, not technical complexity.

With Elected Officials (Board Members, Council): These people care about constituent service, budget concerns, and political implications. They want to know: Is IT serving the public well? Are we spending tax dollars wisely? Are we managing risk appropriately? Will this make me look good or bad to my constituents?

Your communication needs to be transparent, accessible, and focused on public value. Use plain language. Avoid jargon. Show how IT decisions affect service delivery to citizens. Be prepared to explain things multiple times in different ways.

With Department Heads: These people care about their own department's mission and operations. Their focus is reliability. IT needs to work so they can serve their constituents. They want to know: Will this help or hurt my department? How long will it take? What do I need to do? What will it cost me?

Your communication needs to be collaborative and responsive. Listen to their concerns. Understand their priorities. Frame IT initiatives in terms of how they serve departmental needs. Build partnership, not vendor-customer relationships.

With Your IT Team: These people care about doing good work, feeling valued, understanding how their work matters, and having a path for growth. They want to know: What's the vision? Where do I fit? Am I doing well? What's coming next? Does leadership have my back?

Your communication needs to be honest, frequent, and connective. Create context for why decisions are made. Explain how their work contributes to the mission. Provide feedback, both positive and developmental. Be transparent about challenges. Create space for their input and concerns.

The mistake many leaders make is trying to communicate the same way to all these audiences. But what works for your IT team doesn't work for elected officials. What works for the county executive doesn't work for department heads.

You have to adapt. You have to translate. You have to meet each audience where they are, in the language they speak, addressing the concerns they have.

Active Listening: The Most Underrated Communication Skill

Most technical leaders miss this: they think communication is primarily about talking, about delivering information clearly, explaining things well, making their case persuasively.

But the most important communication skill is listening. Real listening. Active listening.

Active listening means:

- Giving someone your full attention, not thinking about what you're going to say next
- Asking clarifying questions to make sure you understand what they're saying
- Reflecting back what you heard to confirm understanding

- Being curious about their perspective, not defensive about your own
- Noticing what's not being said, the emotions, the body language, the subtext

Most leaders are terrible at this. We interrupt. We jump to solutions. We dismiss concerns because we've heard them before. We listen just long enough to formulate our response, then we stop listening.

But when you listen to people, when they feel heard and understood, it transforms the relationship. They trust you more. They're more willing to engage. They bring you information earlier. They give you the benefit of the doubt when things don't go perfectly.

A CIO told me about a conflict she had with a department head who was constantly criticizing IT. She initially got defensive and tried to explain why the department head's complaints weren't fair. It just made things worse.

Finally, she tried a different approach. She scheduled a one-on-one conversation with the department head and just listened. Really listened. Didn't defend. Didn't explain. Just asked questions and tried to understand.

What she discovered was that the department head wasn't mad about IT performance. He was overwhelmed by organizational changes that had nothing to do with IT, and IT was just an easy target for his frustration. Once she understood that, she was able to address the real issue. She offered support in ways that mattered to him. She became a partner instead of a target.

That only happened because she listened.

Active listening is a skill strongly correlated with leadership success, yet it's the skill least practiced by technical leaders. The gap between knowing this matters and actually practicing it is enormous.

Clarity and Conciseness: Respecting People's Time

In local government, everyone is overwhelmed. People get hundreds of emails a day. They attend back-to-back meetings. They're juggling multiple priorities. Their attention is a scarce resource.

It means your communication needs to be clear and concise. Get to the point. Say what needs to be said. Don't bury the lead in paragraphs of preamble.

That doesn't mean being curt or cold. It means respecting people's time by being thoughtful about what you communicate and how you communicate it.

Before you write an email or call a meeting, ask yourself:

- What's the actual purpose of this communication?
- What do I need people to know, understand, or do?
- What's the most important point?
- What's the minimum information needed to convey that point effectively?

If you can't answer these questions clearly, you're not ready to communicate yet.

One practice that works: for important written communications, draft it, then cut it in half. Then ask yourself if the message is still clear. If it is, you've probably gotten rid of the fluff and kept what matters.

For meetings, establish a clear agenda and stick to it. Know what decision or outcome you need. Don't let meetings become open-ended discussions that waste everyone's time.

This discipline shows respect for people. And people respond to that.

According to Microsoft's 2024 Work Trend Index research, 68% of employees say they struggle with the pace and volume of work, and on average employees spend the majority of their time communicating rather than creating. Conciseness cuts through information overload. It's a discipline worth developing.

Tone and Body Language: The Message Beneath the Message

An aspect that technical leaders often miss: how you say something matters as much as what you say. Maybe more.

Your tone of voice, your body language, your facial expressions, these communicate meaning that's often more powerful than your words.

You can say "That's a good idea" with a tone and expression that communicates real interest and appreciation. Or you can say the same words with a tone and expression that communicates dismissal or condescension.

People pick up on this. They're reading your subtext constantly. And if there's a disconnect between your words and your tone, they'll believe the tone.

This is especially important in high-stakes or emotional conversations. If you're delivering difficult feedback, your tone needs to convey respect and care, not judgment. If you're in a conflict, your body language needs to show openness to understanding, not defensiveness.

One simple practice: before important conversations, pause and check your own emotional state. Are you frustrated? Defensive? Rushed? Those emotions will come through in your communication even if you don't intend them to.

Take a breath. Get centered. Remember that the person you're about to talk to is doing their best with the information and capacity they have. Approach the conversation with real curiosity and respect. Your tone and body language will follow.

Research suggests that nonverbal cues, body language and tone of voice, carry far more weight than the actual words you use. If your non-verbal communication contradicts your words, people will believe the non-verbal every time.

Feedback Mechanisms: Making Communication Two-Way

Communication can't just flow one direction, from you to everyone else. It has to flow both ways. People need channels to give you feedback, raise concerns, ask questions, and share ideas.

Establish formal and informal feedback mechanisms:

Formal:

- Regular surveys (engagement surveys, satisfaction surveys)
- Town halls with structured Q&A
- Anonymous feedback channels (suggestion boxes, online forms)
- Skip-level meetings where you meet with people who don't report directly to you
- Performance review conversations that are genuinely two-way

Informal:

- An open-door policy that's real, not just stated
- Regular presence in the office or out in departments (management by walking around)
- Casual conversations over coffee or lunch
- Being approachable and responsive when people do reach out

People need to feel safe giving you honest feedback. If they think honesty will be punished or ignored, they won't be honest. They'll tell you what they think you want to hear. And you'll lose access to the information you need to lead effectively.

The work requires humility. It requires being willing to hear things that are uncomfortable. It requires acting on feedback when appropriate and explaining why you're not acting on it when you have good reasons not to.

But when you create real two-way communication, you build trust. And trust is what all of this rests on.

Storytelling: Making Communication Memorable

People don't remember data or bullet points. They remember stories.

If you want your communication to stick, if you want people to internalize your vision, understand your values, or remember your message, you need to tell stories.

You don't have to be theatrical. Use examples, anecdotes, and narratives to make your point.

Instead of saying "We need to focus on customer service," tell a story about a time when your team went above and beyond for a customer and the impact it had. Instead of saying "Our values include innovation," tell a story about someone who took a calculated risk and what it led to.

Stories create emotional connection. They make abstract concepts concrete. They're how humans have communicated important information for thousands of years. Use them.

Here's why stories work: they engage multiple parts of the brain simultaneously. When you present data, you're activating the analytical centers. When you tell a story, you're activating analytical, emotional, sensory, and memory centers. The result is what neuroscientists call "neural coupling." The listener's brain activity begins to mirror the storyteller's, creating deeper understanding and retention.

Types of stories IT leaders should tell:

Success stories: Share specific examples of how IT enabled organizational success. "When Public Health needed to launch emergency vaccination clinics, our team deployed mobile check-in systems in 48 hours. This allowed them to serve 200 additional people per day per site. That's 15,000 more citizens vaccinated in the first month."

Challenge stories: Be honest about obstacles and how you're addressing them. "Last quarter we had three major system outages. Here's what went wrong, what we learned, and the specific changes we've made to prevent this going forward." This builds trust through transparency.

Value stories: Illustrate your organizational values in action. "When Sarah discovered a security vulnerability at 5 PM on Friday, she didn't clock out and deal with it Monday. She stayed, brought in the team, and worked through the weekend to close the gap before it could be exploited. That's what 'commitment to security' means here."

Vision stories: Help people see the future you're building toward. "Imagine a citizen who needs a building permit. Instead of taking time off work to come to three different offices over two weeks, they go online, upload their plans, get automated code checking, and receive approval in 48 hours. That's where we're heading with digital services."

Connection stories: Show how individuals' work connects to organizational mission. "When you fixed that printer in the Elections office yesterday, you weren't just fixing a printer. You were making sure voter registration forms could be printed accurately. You were protecting democracy. Your work matters."

The most effective leaders I know are master storytellers. They have a repertoire of stories they tell repeatedly, at staff meetings, in board presentations, in one-on-ones. These stories become part of organizational culture. People retell them. They take on life of their own.

Driving Vision, Culture, and Engagement Through Communication

Everything you've read so far comes down to this: communication is how you drive vision, shape culture, and create engagement.

Vision is communicated through:

- Consistent messaging about where the organization is going and why it matters
- Stories that illustrate what success looks like
- Regular reminders that connect daily work to larger purpose
- Transparency about progress, setbacks, and what's next

Culture is communicated through:

- What you pay attention to and what you reward

- How you respond to success and failure
- The behavior you model in your own communication
- The values you explicitly talk about and implicitly model

Engagement is created through:

- Making people feel heard and valued
- Providing clarity about expectations and priorities
- Showing how individual work contributes to collective success
- Building real relationship and trust

All of this happens through communication. Not occasional communication. Not just when things are going well. Consistent, deliberate, multi-level communication that reaches people where they are and speaks to what they care about.

According to Gallup's ongoing workplace research, organizations with strong communication practices have significantly higher employee engagement, lower turnover, and higher productivity than those with weak communication. The differences are meaningful. Gallup's meta-analyses consistently find that top-quartile business units outperform bottom-quartile units by double-digit percentages across key metrics. Communication isn't a soft skill; it's a performance driver.

The Investment That Matters Most

If you're a CIO or senior IT leader and you're not investing significant time in communication, you're undermining every other initiative in your portfolio.

You can have the best technical strategy in the world. If you can't communicate it clearly, it won't get implemented.

You can have the most talented team. If you're not communicating with them consistently and building relationship, they won't be engaged.

You can have strong relationships with some people. But if you're not connecting with all your key audiences, you'll hit walls you didn't see coming.

Communication is not something you do in addition to your real work. Communication is your real work.

The question is: are you willing to treat it that way? Are you willing to invest the time in one-on-ones, in understanding different audiences, in listening actively, in building two-way feedback, in crafting messages that land?

If the answer is yes, you'll be amazed at what becomes possible. Trust builds, engagement increases, and your initiatives move forward more smoothly. Your team performs better and your partners become real partners.

All because you learned to communicate well.

That's not soft skills. That's leadership.

How This Connects to the Broader Framework

If there's one competency that touches every other section in this book, it's communication:

All previous sections in Module 1 depend on communication:

- Communication touches every competency in Module 1. Articulating your purpose (Section 1.1), setting boundaries around your time (Section 1.2), getting honest feedback for self-awareness (Section 1.3), adapting your message for political audiences (Section 1.4), these are all communication acts.

Module 2: Building a Healthy Organization is built entirely on communication:

- Your leadership team (Section 2.1) cannot function without trust, which requires consistent communication
- Vision and purpose (Section 2.2) must be communicated constantly, or they become wall decorations
- Organizational structure (Section 2.3) only works if communication flows through it
- People development (Section 2.4) happens primarily through one-on-ones and coaching conversations
- Culture (Section 2.5) is shaped through daily communication about what matters
- The communications section (Section 2.6) provides the organizational infrastructure for the personal skills developed here

Module 3 depends on communication at every turn:

- Governance (Section 3.1) is a communication process, leaders understanding priorities, making decisions together
- Strategic planning (Section 3.2) must be communicated to translate into action
- Every element of alignment depends on clarity created through communication

Modules 4 and 5 assume communication competence. Service excellence depends on clear expectations. Continuous improvement runs on feedback loops. Both are communication mechanisms.

Communication is the medium through which leadership happens. Every competency in this module depends on your ability to convey it clearly. The best strategy, the strongest technical work, none of it creates value if people don't hear it, understand it, and act on it.

Key Takeaways

- Communication is your real work as a leader, not something you do in addition to technical work

- The hierarchy of communication needs: one-on-ones are most effective, written communication least effective
- Most leaders spend too much time on low-effectiveness communication (email) and too little on high-effectiveness communication (one-on-ones)
- Different audiences require different communication approaches, adapt to their needs and styles
- Active listening is more important than persuasive speaking
- Clarity and conciseness respect people's time and attention
- Tone and body language often communicate more than words
- Stories create emotional connection and make messages memorable
- Two-way feedback mechanisms build trust and organizational learning
- Vision, culture, and engagement are all built through consistent, deliberate communication

Reflection Questions

Before concluding this module, honestly assess your communication effectiveness:

1. What percentage of your communication time is spent in one-on-ones versus emails? Does that allocation match the relative effectiveness of each medium?
2. How often do you adjust your communication style based on audience needs rather than your own preferences?
3. In your last difficult conversation, how much time did you spend listening versus explaining your position?
4. Can every member of your team articulate the organization's top three priorities in their own words? If not, that's a communication gap.
5. Do people feel safe giving you honest feedback? How do you know?
6. What stories do you tell repeatedly to reinforce vision and values? If you can't name three, you're not using storytelling enough.
7. How often do you communicate "why" behind decisions versus just communicating "what" needs to happen?

The working documents for this section are in Appendix A.1.5.

Module 1: Summary

Being a Government IT Leader: The Personal Starting Point

Something most government IT leaders figure out the hard way: technical skill is what got you promoted, but it's not what makes you effective in the role. The CIOs who struggle aren't the ones lacking technical knowledge. They're the ones who never made the shift from technologist to organizational leader, who keep solving technical problems while leadership problems go unaddressed.

Module 1 is about making that shift deliberately. The five competencies in this module aren't theoretical. They're the specific capabilities that separate CIOs who create lasting value from CIOs who stay stuck in reactive mode:

1. **Knowing your purpose and role** (Section 1.1). Understanding that your job is to serve the organization through technology, not to achieve technical perfection

2. **Prioritizing your time** (Section 1.2). Protecting time for strategic leadership work instead of drowning in operational urgency

3. **Developing self-awareness** (Section 1.3). Understanding your strengths, gaps, and impact on others

4. **Handling politics and ambiguity** (Section 1.4). Building relationships and managing the political realities of local government

5. **Communicating effectively** (Section 1.5). Connecting with diverse audiences through multiple channels and approaches

These competencies reinforce each other. Self-awareness helps you handle politics more skillfully. Communication skills enable you to articulate your purpose. Time prioritization creates space for relationship-building. Together, they make the rest of the HPG-IT Framework possible.

Common Pitfalls to Avoid. Watch for these common mistakes as you develop your leadership foundation:

- Treating leadership development as something you'll do when things slow down. Things don't slow down. If you wait for the right time, you'll never start. Block the time now, protect it, and treat it as real work.
- Focusing on technical credibility instead of leadership effectiveness. Your team already knows you're technically competent, that's how you got the role. What they need from you now is direction and support. Time spent proving technical expertise is time not spent leading.
- Skipping the self-awareness work. It's uncomfortable to honestly assess your weaknesses. But the CIOs who stall are almost always the ones who can't see their own blind spots. Get the feedback. It's the fastest path to growth.
- Underestimating the importance of relationships. You might assume good work speaks for itself. In local government, relationships determine whether your good work gets funded and sustained. Invest in them.

- Trying to develop all five competencies simultaneously. Pick your weakest area and focus there first. Depth beats breadth in leadership development.

Integration with Broader Framework

Recognize how the competencies you've developed here enable the work ahead:

Module 2: Building a Healthy Organization requires the leadership competencies from Module 1. Building a healthy organization requires:

- Clear purpose (Section 1.1) that translates into organizational vision
- Protected time (Section 1.2) for team development and culture work
- Self-awareness (Section 1.3) about your impact on organizational culture
- Political skills (Section 1.4) to build your leadership team and manage stakeholder relationships
- Communication ability (Section 1.5) to articulate vision and build culture

Module 3: Working on the Right Stuff builds on Module 1 by applying your leadership competencies to organizational processes:

- Your clarity about purpose shapes governance and strategy
- Your time management determines whether strategy translates to execution
- Your self-awareness helps you recognize when personal preferences interfere with organizational needs
- Your political navigation enables stakeholder-driven governance
- Your communication keeps the organization aligned

The work you've done in Module 1 isn't complete, leadership development is continuous. But you've done the groundwork. Now it's time to apply these competencies to building a healthy organization.

Next Steps

1. **Create your 90-day development plan** using the template in Appendix A.1.M

2. **Share your plan** with your supervisor or a trusted mentor and ask for their input

3. **Schedule monthly check-ins** with yourself or an accountability partner

4. **Begin Module 2** when ready, applying your strengthened leadership competencies to organizational health

The goal isn't perfection. It's ongoing progress on the competencies that matter most for your success. Small improvements in leadership effectiveness create outsized impacts on organizational performance.

You're not just managing IT anymore. You're leading an organization. The competencies in this module determine whether that leadership creates lasting value or perpetual frustration.

The choice, and the work, are yours. But now you have the roadmap.

You've completed Module 1: Being a Government IT Leader.

Everything that follows in this book depends on the competencies you've started building here. You can't build a healthy organization (Module 2) without leadership capability, and you can't align strategy (Module 3) without the groundwork from this module.

Take time to internalize what you've learned. Create your development plan. Begin practicing these competencies intentionally. Then, when ready, proceed to Module 2: Building a Healthy Organization, where you'll apply these leadership skills to building the organization that can execute your vision.

Module 1 at a Glance

Section 1.1: Know Your Purpose and Role

Core Principle: Your job is to enable the organization through technology, not to protect technology from the organization.

Quick Actions:

- Write a one-paragraph statement of your actual purpose (not your job description)
- Test every major decision against: "Does this serve the organization's mission?"
- Replace "best practice" language with "organizational outcome" language

Section 1.2: Prioritize Your Time on What Matters Most

Core Principle: Strategic leadership work creates lasting value; operational work feels productive but maintains status quo.

Quick Actions:

- Track your time for one week: operational vs. strategic
- Block 2 hours per week for strategic thinking (protect ruthlessly)
- Schedule recurring one-on-ones with all direct reports

Section 1.3: Inventory Your Core Leadership Principles and Competencies

Core Principle: Self-awareness is the basis of leadership effectiveness; you can't improve what you don't acknowledge.

Quick Actions:

- Request 360-degree feedback or structured conversations with 3–5 trusted advisors
- List your top 3 strengths and top 3 development gaps
- Create a 90-day development plan with specific actions

Section 1.4: Handle Ambiguity and Politics Well

Core Principle: Relationships and political navigation determine your success more than technical competence.

Quick Actions:

- Map your key stakeholder relationships (rate 1–5)
- Schedule coffee meetings with your 3 most important stakeholders
- Identify the informal influencers in your organization

Section 1.5: Be a Good Communicator

Core Principle: Communication is your real work; one-on-ones create more value than any amount of email.

Quick Actions:

- Spend more time in one-on-ones than in email this week
- Collect 3 stories that illustrate your vision and values
- Practice active listening in your next 5 conversations

Final Thoughts

You've now completed Module 1: Being a Government IT Leader, the foundation of the HPG-IT Framework. Everything that comes next builds on the competencies you've started developing here.

Key Reminders:

1. **You won't master these competencies in 90 days.** But you can make significant, measurable progress that transforms your effectiveness.

2. **Start where you are.** Don't try to work on everything at once. Pick your highest-priority development area and focus there first.

3. **Practice deliberately.** Reading about these competencies isn't enough. You must practice them in real situations, get feedback, adjust, and practice again.

4. **Seek support.** Leadership development is hard to do alone. Find a mentor, coach, or peer group that can support your growth.

5. **Be patient with yourself.** You'll have setbacks. You'll revert to old patterns under stress. That's normal. What matters is recommitting to growth.

6. **Measure progress.** Revisit the Module 1 Self-Assessment in Appendix A.1.M every 90 days. Track how your scores change. Celebrate improvements.

7. **Connect to purpose.** Remember why this matters. You're not developing these competencies for their own sake. You're developing them so you can serve your organization more effectively, build a high-performing team, and create real value for the citizens you serve.

You're Ready.

The groundwork is done. You understand what leadership requires in local government IT. You have a roadmap for developing the competencies that matter most.

Now it's time to apply these leadership capabilities to building organizational health, the subject of Module 2.

The work continues. But you're no longer working blind. You have clarity, direction, and a structure for growth.

That's powerful. Use it well.

The working documents for this module are in Appendix A.1.M.

MODULE 2

BUILDING A HEALTHY ORGANIZATION

Introduction to Module 2

I've visited dozens of IT departments over the years. Some are thriving, people are engaged, customers are satisfied, systems are running well. Others are struggling, constant turnover, frustrated customers, staff who look exhausted and defeated.

The difference is rarely about technology. It's almost never about budget or staff size.

The difference is organizational health.

Healthy organizations have something that struggling organizations don't: a foundation. Shared values that guide decisions. A culture where people want to work. Clear structure that enables accountability. Investment in people. Honest communication.

These sound like soft skills, but they're what makes an IT organization work.

You can have the best IT strategy in the world. If your organization isn't healthy, that strategy won't get executed. You can hire talented people, but if the culture is

toxic, they'll leave. And new technology won't get used well if people don't see how their work connects to purpose.

Organizational health isn't a nice-to-have. It's the prerequisite for every other goal you pursue as a CIO.

The Five Pillars of Organizational Health

Building a healthy IT organization requires deliberate work across five interconnected areas:

Section 2.1: Your Leadership Team, Building a cohesive, high-performing leadership team that operates with alignment, trust, and shared accountability. This is the foundation. If your leadership team is dysfunctional, the entire organization will be dysfunctional. (This section builds directly on the leadership competencies you developed in Module 1.)

Section 2.2: Vision and Purpose, A shared direction that connects daily work to purpose. When people understand why their work matters and what the organization stands for, they make better decisions and stay engaged even when things get hard. (Your personal clarity about purpose from Module 1, Section 1.1, translates here into organizational vision.)

Section 2.3: Organizational Structure, Clear roles, authority, and decision-making paths. People need to know who's responsible for what, how decisions get made, and where they fit in the organization. Ambiguity creates friction and wastes energy. (The governance structures in Module 3, Section 3.1, depend on having the right organizational structure in place first.)

Section 2.4: Capabilities and People, Talent recruitment, development, and career growth. Your organization is only as strong as the people in it. Are you deliberately building capability? Or are you just filling positions and hoping for the best? (The time prioritization skills from Module 1, Section 1.2, enable you to invest in people development.)

Section 2.5: Culture and Environment, Psychological safety, collaboration, and continuous learning. This is the environment people work in every day. Is it a place where people feel valued and supported? Or is it a place where they're just surviving? (Your communication skills from Module 1, Section 1.5, are essential for shaping culture.)

Section 2.6: Communications, Transparent information flow and honest feedback. Everything flows through communication. If information doesn't flow well, nothing else works right. (This section provides organizational infrastructure for the personal communication skills developed in Module 1, Section 1.5.)

These five pillars are interconnected. Culture affects how people develop. Structure affects communication. Values shape culture. You can't fix one in isolation. But you can work on all of them systematically.

This module tackles that work.

Why This Matters Now

In local government IT, the pile-up is real. Cybersecurity threats. Aging infrastructure. Budget constraints. Artificial Intelligence. Staffing shortages. Constant pressure to innovate. Elected officials and executives who have high expectations and limited understanding of IT complexity.

You can't solve these challenges with technology alone. You solve them by building an organization that can adapt, learn, and keep delivering when things get hard.

That only happens when the organization itself is healthy.

The connection between organizational health and performance is well-documented. McKinsey's Organizational Health Index research has consistently found that organizations in the top quartile for organizational health deliver three times the total returns to shareholders compared to those in the bottom quartile. For government organizations, the outcomes are equally compelling: higher employee engagement, better service delivery, stronger business relationships, and greater ability to execute strategy.

How This Module Builds on Module 1

The leadership competencies you developed in Module 1 are prerequisites for the work in this module:

Your Purpose and Role (Module 1, Section 1.1) anchors organizational vision (Section 2.2). You cannot authentically lead vision work if you haven't first clarified your own purpose.

Time Prioritization (Module 1, Section 1.2) makes the rest of this module possible. Building your leadership team (Section 2.1) requires protected time. Developing people (Section 2.4) requires one-on-ones and coaching. Shaping culture (Section 2.5) requires consistent presence and attention.

Self-Awareness (Module 1, Section 1.3) determines your impact on organizational culture. If you're unaware of how you affect team dynamics, you cannot build a healthy leadership team or shape a positive culture.

Political Navigation (Module 1, Section 1.4) is essential for building your leadership team and managing the competing interests within it. Structure decisions (Section 2.3) are inherently political.

Communication Skills (Module 1, Section 1.5) are the primary tool for everything in this module. You shape culture, build vision, and develop people through communication.

The leadership competencies from Module 1 make the work in Module 2 far more effective. With them in place, you're ready to apply those capabilities to building organizational health.

What's Ahead

The sections that follow provide practical guidance for building each pillar of organizational health. Each section includes:

- Why this pillar matters for organizational performance
- What healthy looks like versus unhealthy
- Practical steps to strengthen this area
- Common pitfalls and how to avoid them
- Cross-references to tools and templates in Appendix A: The Field Guide
- Cross-references to related content in other modules

This comes from what works in local government IT organizations, facing your constraints, serving communities like yours.

If you're ready to move beyond keeping the lights on and start building something sustainable, an organization where talented people want to work, where people see IT as a partner, where strategy gets executed, this module shows you how.

Let's build organizational health together.

Section 2.1

Your Leadership Team

I walked into a leadership team meeting years ago and immediately felt the tension. My Infrastructure Manager and Applications Manager were debating, again, about whose responsibility it was to handle a system outage. The Help Desk Manager looked frustrated because neither of them had communicated with her team about the issue. My Security Manager sat silently, clearly checked out.

This wasn't an isolated incident. It was the pattern. My leadership team operated as a collection of individuals managing their own silos, not as a cohesive team leading a unified IT department.

And that was my fault.

I'd been so focused on building individual relationships with each of my direct reports that I'd neglected to build them as a team. I'd been delegating tasks without creating coherence. I'd been holding people accountable to their individual areas without creating shared accountability for our collective success.

The result? Friction at boundaries, duplicated effort, and dropped balls when work crossed domains. Staff confusion about priorities because their managers weren't aligned. And a leadership team that wasn't leading, they were just managing their own territories.

That moment was a turning point. I realized that if I wanted to build a high-performing IT organization, I had to start by building a high-performing leadership team.

Why Your Leadership Team Matters More Than You Think

An insight that took me too long to understand: as a CIO, you don't run the IT department. Your leadership team does.

You can set direction. You can establish vision and strategy. You can build relationships with executives and business partners. But the daily reality of how IT

operates, how decisions get made, how problems get solved, how culture gets shaped, how people experience working in your organization, that all flows through your leadership team.

If your leadership team is dysfunctional, siloed, or operating without coordination, it doesn't matter how brilliant your strategy is. The organization will struggle. People will be confused. Work will fall through cracks. Politics will emerge. Good people will leave.

Conversely, if you build a strong, cohesive leadership team that operates with alignment and shared purpose, everything gets easier. Decisions get made faster. Problems get solved faster. People understand priorities. Collaboration happens naturally. The organization builds momentum.

This is especially critical in local government IT departments. You don't have layers of management between you and the front line. You likely have a leadership team of three to seven direct reports, each managing a critical function. These people are your force multipliers. They're how you scale your leadership across the organization.

If you're not investing heavily in building them as a team, you're capping your organization's potential.

Research on organizational performance consistently shows that executive team alignment is among the strongest predictors of outcomes, often exceeding the impact of strategy quality, market position, or individual leader capability. In government specifically, research confirms that leadership team cohesion strongly predicts employee engagement, service delivery quality, and stakeholder satisfaction.

The Trap of Individual Relationships

Most CIOs fall into the same trap I did: they focus on building strong individual relationships with each direct report, but they neglect to build the team as a whole.

This makes intuitive sense. You have regular one-on-ones with each person. You understand their challenges. You provide guidance and support. You think, "If I'm supporting each leader individually, the team will be strong."

But that's not how it works.

A collection of strong individual leaders does not automatically become a strong leadership team. In fact, strong leaders without team cohesion often create more problems than weak leaders who collaborate well.

Why? Because strong leaders without alignment will pull the organization in different directions. They'll optimize for their own area at the expense of others. They'll compete for resources. They'll create friction at boundaries because they're protecting their territory. They'll send conflicting messages to staff about what matters most.

Your job as CIO is not just to develop individual leaders. It's to forge them into a team that operates with shared purpose, mutual accountability, and tight coordination.

That requires deliberate work. It doesn't happen by accident.

What a High-Performing Leadership Team Looks Like

Before we talk about how to build one, let's be clear about what we're building toward.

A high-performing leadership team:

Shares a common understanding of vision and priorities. Everyone can articulate what the IT department is trying to accomplish and why it matters. They're aligned on what's most important. There's no confusion about direction.

Operates with trust and psychological safety. People feel safe raising concerns, admitting mistakes, asking for help, and challenging each other. There's no posturing or politics. Disagreements are productive, not personal.

Has clear roles and responsibilities, but doesn't hide behind them. People know what they own. But they also feel shared responsibility for the department's overall success. They help each other. They don't say "that's not my area" when something needs attention.

Communicates early and transparently. Information flows freely. People share what's happening in their areas before it becomes a crisis. They surface problems early. They coordinate naturally when work crosses boundaries.

Makes decisions together when appropriate, and commits to them. For issues that affect the whole department, the team engages collectively. People have input. Decisions get made with diverse perspectives considered. The critical part: even when individuals disagree with a decision, they commit to it fully. This is the difference between alignment and agreement, and it matters for high-performing teams.

Holds each other accountable. To you and to each other. If someone isn't delivering, the team addresses it. If someone's area is creating problems for others, it gets surfaced and resolved. Accountability is shared, not just top-down.

Models the culture you want in the broader organization. If you want collaboration, your leadership team needs to model it. If you want transparency, they need to be transparent. If you want continuous improvement, they need to be visibly learning and adapting. Culture cascades from the top.

That's the standard. It's what you're building toward. And most leadership teams are nowhere near this. The CIO simply hasn't invested in building the team.

Alignment vs. Agreement: A Critical Distinction

Before we go further, I need to address something that gets confused constantly: the difference between alignment and agreement.

Many leaders think they need agreement from their team to move forward. They pursue consensus. They want everyone to be on board before making decisions. This sounds collaborative and inclusive. And it's a recipe for paralysis.

What this comes down to: agreement is nice to have. Alignment is a must have.

The difference matters:

Agreement means everyone concurs with the decision. Everyone thinks it's the right call. Everyone would have made the same choice.

Alignment means everyone commits to supporting and executing the decision, even if they personally disagree with it.

You don't have to agree with a decision to be in alignment and support it. But you do have to commit to it.

This matters because your leadership team is diverse. Different personality types. Different work experience. Different roles and responsibilities. Different skills and education. Different cultural heritage. Different life experiences.

With this diversity, which is a strength, it's almost certain that 100% agreement across your team is nearly impossible to achieve. You're chasing a unicorn. You'll never catch it.

And frankly, you shouldn't want to. If everyone always agrees with you, one of two things is happening: either you're not making hard decisions, or people aren't being honest with you.

The value of diverse input in decision-making is enormous. You want people to challenge your thinking. You want different perspectives. You want healthy debate. This makes decisions better. Don't let the potential for disagreement dissuade you from this practice.

But here's where many leaders get stuck: after gathering input and making a decision, some team members disagree. Maybe strongly. And they communicate that disagreement, not just in the decision-making moment, but afterward. To their teams. To business partners. Through their body language and lack of commitment.

Leadership breaks down here.

Once a decision is made, everyone needs to be in alignment. This means:

- They commit to the decision fully, even if they disagree with it
- They communicate it to their teams as "our decision," not "the CIO's decision I don't agree with"
- They support the execution of the decision with their full effort
- They don't undermine it through passive resistance or subtle sabotage

Teams and organizations cannot be successful if some team members opt out of supporting and executing decisions they didn't personally agree with. It creates confusion. It undermines leadership. It signals to staff that they can also opt out of things they don't like. It fractures the organization.

That's not blind obedience. Your leadership team should absolutely voice disagreement during the decision-making process. They should challenge you. They should advocate for their perspective. They should push back when they think something's wrong.

But once the decision is made, they have two options: commit fully or remove themselves from the team.

Holding back commitment because you don't agree is not an option in most employment situations. You can disagree and commit. You can't disagree and undermine.

I learned this the hard way with a manager who consistently expressed disagreement with decisions to her team. She'd say things like "I don't agree with this, but the CIO wants us to do it." Technically, she was executing the decision. But she was doing it in a way that undermined it. Her team felt conflicted. They didn't fully commit. The initiative struggled.

When I addressed it with her, she said, "But I am doing what you asked. I just don't agree with it." And I said, "That's not alignment. Alignment means you commit to it publicly and support it fully, even when you disagree. If you can't do that, we need to talk about whether that's the right role for you."

That conversation changed things. She either needed to get in alignment or find a different team. She chose alignment. And once she did, once she stopped signaling disagreement to her team, the initiative moved forward successfully.

To build this discipline in your leadership team:

Be explicit about the expectation. Tell your team directly: "I want your honest input. I want you to challenge decisions you disagree with during our discussions. But once we make a decision as a team, I expect full commitment. If you disagree, you still need to communicate and execute it as our decision, not as something you were forced to do."

Model it yourself. There will be decisions your boss or the agency executive makes that you don't personally agree with. How you handle those moments teaches your team how to handle yours. Do you undermine those decisions through subtle signals? Or do you commit and execute, even when you disagree?

Address violations directly. If someone on your team is not in alignment, if they're undermining decisions through their words or actions, address it immediately. Don't let it fester. Have the conversation. Make clear that this is a fundamental expectation of leadership.

Create space for legitimate disagreement. People are more willing to commit to decisions they disagree with if they feel they had a genuine opportunity to be heard. Ensure your decision-making process includes real input. Listen to objections. Consider them seriously. People can live with decisions they disagree with if they know their perspective was genuinely considered.

Revisit decisions when new information emerges. Alignment doesn't mean decisions are permanent. If circumstances change or new information comes to light, be willing to revisit decisions. People trust that you're making decisions based on information, not ego.

While agreement is a bonus, alignment is a requirement. Build a leadership team that understands this distinction and operates accordingly. When you do, you'll find that decisions move forward more smoothly, even when they're hard. Your team will be unified even when individual members disagree. And your organization will build momentum instead of getting stuck in endless debate and half-hearted execution.

This is what high-performing teams do. They disagree and commit. They understand that alignment is how teams actually get things done.

Building the Team That Builds the Organization

Building a high-performing leadership team starts with you. You set the tone through clear expectations, consistent practices, and deliberate team development.

Establish clear expectations about how the team operates.

Be explicit about what you expect from your leadership team, from individuals and from the team collectively.

Do you expect them to operate as a team, not just as individual managers? Say that.

Do you expect them to share information early and coordinate across areas? Say that.

Do you expect them to raise concerns and challenge decisions when they disagree, but commit fully once decisions are made? Say that.

Do you expect them to hold each other accountable, not just report problems up to you? Say that.

Don't assume people understand these expectations. State them clearly. Revisit them regularly. Make them real by reinforcing them when you see them and addressing it when you don't.

Create structures and practices that build team cohesion.

High-performing teams don't emerge from individual one-on-ones. They emerge from shared experiences, regular interaction, and structured practices that build cohesion.

In practice:

Regular leadership team meetings. Not status updates. Real strategic conversations. Problem-solving sessions. Decision-making forums. Time to think together about the challenges the department faces and how to address them. These meetings need to be sacred, protected time where the team works together on the organization, not just in the organization.

Shared goals and metrics. Beyond individual performance goals, establish shared goals that the leadership team owns collectively. The effect is mutual accountability, you succeed or fail as a team, not as individuals.

Team development activities. This might feel soft or unnecessary. It's not. Time spent on team building, whether it's offsite retreats, shared learning experiences,

or structured exercises that build trust, is an investment in your organization's capacity to function well.

Cross-functional projects and initiatives. Create opportunities for leaders to work together on initiatives that cut across their individual areas. It builds relationships, breaks down silos, and shows the value of collaboration.

Research on high-performing teams shows that structured team-building activities can meaningfully improve team effectiveness, with the strongest gains in trust, communication, and collaborative problem-solving.

Delegation and Trust: Building Through Your Team

If you're doing work your leadership team should be doing, you're failing both them and yourself.

Your job is not to be the smartest person in the room or to make every decision. Your job is to build a team capable of running the IT department without your constant involvement. It takes real delegation and real trust.

Delegation means:

- Giving people real authority to make decisions in their areas
- Not micromanaging or second-guessing their judgment
- Letting them own outcomes, both successes and failures
- Providing guidance and support, but not doing the work for them

Empowerment means:

- Trusting people to solve problems without waiting for your permission
- Creating clarity about what decisions they can make autonomously
- Removing obstacles that prevent them from being effective
- Giving them visibility and credit for their work

If you went on vacation for two weeks, would your IT department continue to operate effectively? If the answer is no, you haven't delegated. You've created dependency instead of capability.

A CIO I know used to joke that his goal was to make himself unnecessary. He meant it. He invested heavily in building his leadership team's capability so that they could run the organization without him. This didn't diminish his value, it multiplied it. Because instead of being stuck in operational decisions, he could focus on strategy, business relationships, and positioning IT for long-term success.

That only works if you delegate and trust your team.

Driving Leadership Responsibilities to the Ground Level

Here's a critical insight: leadership is not a position. It's a set of behaviors and responsibilities. And those behaviors and responsibilities need to exist at every level of your organization, not just at the top.

Your job as CIO is to drive leadership thinking and responsibility down through your organization. This means:

Your direct reports need to lead their teams, not just manage them.

They need to develop their own people. Build culture in their areas. Create vision for their function. Solve problems before they escalate. Not just execute tasks and report status to you.

Your managers need to develop leadership capacity in their staff.

Even individual contributors should be thinking about how to improve the organization, how to solve systemic problems, how to contribute beyond their immediate role.

Everyone needs to feel ownership for the department's success. Not just their individual tasks. The overall mission and outcomes.

None of that happens naturally. It happens because you model it with your leadership team, and your leadership team cascades it to their teams.

You have to explicitly talk about leadership expectations at every level. Give people opportunities to lead even when it's not in their job title. Recognize and reward leadership behaviors wherever they show up, and yes, that includes your quietest team members. Build a culture where everyone is expected to think strategically, not just tactically.

Done well, this builds an organization where leadership capacity exists throughout, not just at the top. That's when you build resilience and long-term capability.

Being a Coach to Your Team

Your relationship with your leadership team needs to include a strong coaching dimension. You're not just their boss. You're their coach, helping them develop as leaders, working through challenges with them, pushing them to grow.

Effective coaching means:

Asking questions instead of providing answers. When someone brings you a problem, resist the urge to solve it for them. Ask: "What do you think we should do? What are the options? What's your recommendation?" This develops their problem-solving capacity.

Providing feedback, both positive and developmental. People need to know what they're doing well and where they need to improve. Regular, specific feedback is how people grow. Don't wait for annual reviews. Coach in the moment.

Creating stretch opportunities. Give people assignments that are slightly beyond their current capability. This is how they develop. Support them through it, but don't do it for them.

Being vulnerable about your own learning. Share your own mistakes and what you learned from them. Model that leadership is about continuous learning, not having all the answers.

Helping them handle organizational complexity. Your leaders are dealing with challenges they may not have experience with, managing conflict, handling

politics, making difficult decisions. You've been there. Share your perspective and help them build these competencies.

One practice I use: after significant decisions or challenging situations, I debrief with my leadership team. "What did we learn? What would we do differently next time? What worked well that we should do more of?" This develops a learning culture and helps the team continuously improve.

Holding People Accountable to High Standards

Empowerment without accountability is abdication. You need both.

High-performing teams have high standards. People expect excellence from themselves and from each other. Not perfectionism or unreasonable pressure, a shared commitment to doing good work and delivering on commitments.

Your job is to set those standards and hold people accountable to them.

In practice:

Being clear about expectations. People can't meet expectations they don't understand. Be specific about what good performance looks like. What outcomes you expect. What behaviors matter. What success means.

Addressing performance issues directly and quickly. When someone isn't delivering, don't ignore it or hope it improves on its own. Address it. Have the conversation. Provide support and clarity about what needs to change. But don't let it linger.

Holding people accountable to each other, not just to you. If your Infrastructure Manager makes a commitment to your Applications Manager and doesn't deliver, your Applications Manager should be able to address that directly. Your role is to ensure they do, not to mediate every conflict.

Walking the talk. You can't hold your team to standards you don't meet yourself. If you expect them to be responsive and communicative, you need to be responsive and communicative. If you expect them to admit mistakes, you need to admit your own. If you expect them to develop their people, you need to develop them. Your behavior sets the actual standard, not your words.

Recognizing and celebrating excellence. Accountability includes recognizing great work, not only addressing problems. When someone delivers exceptional results, acknowledge it. When the team accomplishes something significant, celebrate it. People repeat behaviors that get recognized.

The balance here is critical. You need to hold high standards without creating a culture of fear. You need to address problems without being punitive. You need to push for excellence while also supporting people through challenges.

That's the art of leadership. And your leadership team is watching how you do it. Because how you lead them is how they'll lead their teams.

Removing Obstacles and Creating Conditions for Success

One of your most important jobs is removing obstacles that prevent your leadership team from being effective.

This might mean:

- Addressing organizational constraints or policies that create unnecessary friction
- Running interference with difficult customers or political situations
- Securing resources or budget when they're needed for critical work
- Resolving conflicts or issues that your leaders can't address on their own
- Providing air cover when they make decisions that create pushback

Your leaders shouldn't have to fight the organization to do their jobs. That's your fight as CIO. Your job is to give them what they need to be successful.

A simple practice: regularly ask your leadership team, "What's getting in your way? What obstacles are you facing? What do you need from me to be more effective?" Then address those things. Don't just acknowledge them, act on them.

Trust grows. You're showing that you're there to support them, not just to extract performance from them. And it shows that you're paying attention to the reality they're operating in, not just the outcomes you want.

The Team That Makes Everything Possible

Your success as a CIO comes down to the capability and cohesion of your leadership team.

If you build a strong team, one that operates with cohesion, trust, shared purpose, and mutual accountability, they'll build a strong organization. They'll cascade good leadership practices. They'll create culture. They'll solve problems before they escalate. They'll develop their people. They'll drive results.

If you neglect your leadership team, if you treat them as individual contributors who report to you rather than as a cohesive team leading the organization, you'll create silos, friction, confusion, and underperformance. No matter how talented the individuals are.

It takes deliberate investment. Time in leadership team meetings that feel strategic, not just administrative. Time coaching your leaders individually and collectively. Time building team cohesion and trust. Time setting clear expectations and holding people accountable. Time removing obstacles and creating conditions for success.

It's not easy. It takes discipline and sustained attention. But it pays off. The investment you make in building your leadership team multiplies across the entire organization.

Because when your leadership team is strong, amazing things happen. Strategy gets executed, culture gets built, and problems get solved. People grow and the organization delivers.

That's not an accident. That's the result of a CIO who understood that their job isn't to run IT, it's to build the leadership team that runs IT.

Are you doing that? Really doing it?

If not, that's where to start.

How This Connects to the Broader Framework

Your leadership team is the mechanism through which everything else in this framework gets executed. They carry your vision, operate your governance, develop your people, and shape your culture. The connections are direct:

The personal leadership work from Module 1 comes first, you can't build this team without it:

- Your purpose clarity (Section 1.1) helps you articulate what the team exists to accomplish
- Your time management (Section 1.2) is what frees you up for the team development work required here
- Your self-awareness (Section 1.3) helps you recognize your impact on team dynamics
- Your political skills (Section 1.4) are how you handle competing interests within the team
- Your communication abilities (Section 1.5) are critical for building trust and alignment

The Rest of Module 2 depends on your leadership team:

- Vision and purpose (Section 2.2) must be embraced by your leadership team before it can cascade to the organization
- Organizational structure (Section 2.3) decisions require leadership team coordination
- People development (Section 2.4) happens through your leadership team's coaching and mentorship
- Culture (Section 2.5) is shaped primarily by leadership team behavior
- Communications (Section 2.6) flow through your leadership team

None of Module 3's strategic alignment work happens without a strong leadership team:

- Governance (Section 3.1) depends on leadership team members representing their areas and making collective decisions
- Strategic planning (Section 3.2) requires leadership team agreement on direction and priorities
- Your leadership team executes portfolio management, frameworks, and budget decisions

When your leadership team isn't working, nothing downstream works either. When they're aligned and pulling together, you can build almost anything.

Key Takeaways

- Your leadership team runs the IT department; if they're dysfunctional, the organization will be dysfunctional
- Individual relationships are necessary but insufficient; you must build the team collectively
- Agreement is nice; alignment is required, team members must commit to decisions even when they disagree
- High-performing teams operate with trust, shared accountability, and mutual support
- Delegation and trust are how you scale your leadership across the organization
- Leadership responsibilities should exist at every level, not just at the top
- Coaching, accountability, and obstacle removal are essential leadership team practices
- The investment you make in your leadership team multiplies across the entire organization

Reflection Questions

Assess your leadership team's health:

1. Can your leadership team articulate your department's vision and top priorities in consistent terms?
2. Do team members share information early and coordinate across boundaries, or do they operate in silos?
3. When was the last time your leadership team had a strategic conversation versus just status updates?
4. Do team members hold each other accountable, or do they only report problems to you?
5. If you were gone for two weeks, would your IT department operate effectively without you?
6. How much time do you invest in building your team collectively versus just individual relationships?
7. Do team members commit fully to decisions even when they personally disagree?

The working documents for this section are in Appendix A.2.1.

Section 2.2

Vision and Purpose

"I need to talk to you about your career." That's how a colleague opened a conversation with one of his talented systems administrators, someone who'd been with the organization for about five years. Smart. Capable. Technically excellent. But clearly disengaged.

"Why do you come to work every day?" he asked. "What gets you excited about this job?"

She paused for a long time. Then she said something that hit hard: "Honestly? I don't know anymore. I used to feel like we were doing something important. But now it just feels like we're keeping systems running and responding to complaints. I can't remember the last time I felt like my work mattered."

That conversation haunted the CIO. Because she was right. And she wasn't alone.

He realized the IT department had gotten so caught up in day-to-day operations, tickets, projects, incidents, meetings, that they'd lost sight of why any of it mattered. They didn't have a compelling answer to the question: What are we trying to accomplish here? What's the point of all this work?

They had a mission statement. It was on the website. But nobody could recite it. Nobody connected their daily work to it. It was just words on a page, not something that guided decisions or inspired effort.

Without a clear, compelling vision and purpose, you're just managing activities. You're not leading toward anything worthwhile. And people feel that emptiness. They might still do their jobs. But they won't bring their full energy and creativity. They won't stay engaged when things get hard. They won't go the extra mile.

Purpose is what transforms a job into work that matters. Vision is what gives direction to all the activity. Together, they're what separate organizations that succeed from organizations that just survive.

Why Vision and Purpose Matter

To be direct: most IT departments don't have a real vision. They have aspirational statements created for strategic plans. They have bullet points about "excellence" and "innovation" and "customer service." They have words that sound good in presentations.

But they don't have a vision that guides decisions, shapes culture, and inspires people. They don't have a purpose that people connect to emotionally.

And that matters more than most CIOs realize.

Vision and purpose serve several critical functions:

They create clarity about direction. When people understand where the organization is going and why, they can make better decisions without waiting for permission. They know what to prioritize. They understand what success looks like. They can self-correct when they're off track.

They provide motivation during difficult times. IT work is hard. Systems fail. Projects run over budget. Customers get frustrated. Staff get overwhelmed. When times are tough, what keeps people going? Purpose. The belief that the work matters and is contributing to something important.

They enable autonomous decision-making. You can't be in every decision. You need people throughout your organization making judgment calls every day. How do they know what to do? If they're clear on the vision and purpose, they can evaluate options against that direction. Without it, they either wait for direction (slowing everything down) or make decisions that might conflict with what you would have wanted.

They attract and retain talent. People, especially younger generations, want work that means something. They want to contribute to something larger than themselves. If your organization doesn't have a compelling vision and purpose, talented people will find organizations that do.

They create agreement across the leadership team and organization.

When everyone is working toward the same vision, guided by the same purpose, coordination becomes natural. When everyone's pursuing their own interpretation of what matters, you get fragmentation and conflict.

The data backs this up. Research consistently shows that organizations with clearly articulated and consistently communicated purpose show higher employee engagement and better retention of high performers. For government organizations specifically, practitioner experience and broader research suggest that purpose-driven teams deliver more successful project outcomes and show stronger resilience during organizational change.

The Difference Between Mission, Vision, Values, and Purpose

Before we go further, let's clarify these terms because they get confused constantly:

Mission answers: What do we do? What services do we provide? This is the functional description of your work. Example: "We provide information technology services and support to county departments and operations."

Vision answers: What are we trying to create or become? Where are we headed? This is the future state you're building toward. Example: "We will be a high-performing IT organization recognized for excellence in service delivery, innovation, and partnership."

Values answer: How do we operate? What principles guide our behavior and decisions? These are the beliefs and standards that shape your culture. Example: "Integrity, collaboration, innovation, customer focus."

Purpose answers: Why does our work matter? What difference are we making? This is the deeper meaning behind the work, the impact on people and mission. Example: "We enable county government to serve citizens effectively through reliable, innovative technology."

All four are important. But purpose and vision are the ones that most IT departments struggle to articulate and operationalize.

Mission is usually clear, you provide IT services. That's obvious.

Values many organizations have identified, even if they're not always living them.

But **purpose** and **vision**? Those require deeper thought. And most organizations haven't done that work. They have placeholder statements that sound good but don't guide anything.

If you want to build organizational health, you need real purpose and vision. Not just words. Real clarity about why your work matters and where you're going.

What Makes Vision Compelling

A compelling vision has specific characteristics. It's not just aspirational fluff. It's something that people can connect to emotionally and practically.

It's clear and concrete. People can picture it. They can understand what it means in practical terms. It's not vague language about "excellence" or "world-class." It describes a specific future state that's recognizable.

Bad example: "We will be a world-class IT organization delivering excellence in all we do."

Better example: "We will be an IT organization where departments see us as partners in solving their challenges, where our systems run reliably and securely, where our team members are growing and engaged, and where we're consistently innovating to improve how government serves citizens."

The second version is concrete. You can imagine what that looks like. You can evaluate whether you're moving toward it or away from it.

It's aspirational but achievable. A good vision stretches you. It requires growth and improvement. It's not just describing the present state. But it's also not pure fantasy. It's something that, with ongoing effort and the right investments, you can accomplish.

If your vision requires resources you'll never have or capabilities that are impossible to build, people won't connect to it. They'll dismiss it as unrealistic. But if your vision just describes what you already are, it won't inspire anyone to change or grow.

It connects to something people care about. This is the emotional component. Why should people care about achieving this vision? What makes it worth pursuing? Usually, this connects back to purpose, to the impact your work has on mission, on citizens, on colleagues.

People don't get excited about "implementing best practices in IT service management." But they might get excited about "enabling county health workers to spend more time serving vulnerable populations and less time fighting with technology."

Same work. Different framing. One connects to purpose. One doesn't.

It's differentiated. Your vision should reflect what makes your organization unique or what you're specifically trying to become. Generic visions that could apply to any IT department anywhere aren't useful. They don't guide decisions because they don't reflect your specific context, challenges, or aspirations.

It's communicated consistently and repeatedly. This is critical. Vision only works if people know it, remember it, and connect their work to it. Most organizations create a vision, present it once, and then wonder why nothing changes. Vision requires constant repetition.

Employees need to hear a vision statement an average of seven times, through multiple channels, before they can accurately recall and internalize it. Leaders who communicate vision monthly or more frequently see markedly stronger connection between stated vision and employee behavior.

Discovering Your Purpose

Purpose is usually already present in your organization. It's not something you invent. It's something you discover and articulate.

Your purpose is the answer to: Why does our work matter? What difference do we make?

For IT in local government, purpose almost always connects to enabling public service. You're not keeping servers running for their own sake. You're keeping servers running so that:

- Health workers can serve vulnerable populations
- Law enforcement can keep communities safe
- Public works can maintain infrastructure
- Finance can manage taxpayer dollars responsibly

- Elections can run fairly and securely
- Citizens can access services conveniently

That's your purpose. You enable mission. You make government work better. You help your organization serve the public effectively.

When you frame IT work in these terms, connecting technology to mission and public service, that reframe matters. The same work carries different weight. The help desk technician who fixes a login problem isn't just resetting passwords. They're making sure a social worker can access case files for a child protection visit. The infrastructure engineer upgrading servers isn't just maintaining systems. They're ensuring emergency services can dispatch first responders without delay.

Same technical work. Different purpose. And that difference is everything.

Here's an exercise I use to help organizations discover their purpose:

Step 1: Ask your team: "What happens when IT doesn't work well? What breaks down? Who suffers?" The answers reveal your purpose, because your purpose is to prevent those negative outcomes.

Step 2: Collect stories about times when IT made a real difference. When a system you built enabled better service. When your quick response prevented a crisis. When your innovation improved how work gets done. These stories contain your purpose.

Step 3: Interview business partners outside IT. Ask them: "When IT is at its best, what difference does it make for your work? For the mission? For citizens?" Their answers reveal how they experience your purpose.

Step 4: Synthesize these insights into a clear statement of purpose. Keep it simple. Keep it human. Keep it connected to impact.

Once you have it, test it. Share it with your team and ask: "Does this resonate? Does this capture why our work matters?" If people's eyes light up and they say "Yes, that's it", you've found your purpose. If they look confused or unmoved, keep working.

Crafting Your Vision

Vision is more deliberate than purpose. It's not discovered, it's created. You're making a choice about where you want to take the organization.

Here's a process that works:

Start with assessment. Where are you now? What's working? What's broken? What are your current strengths and gaps? You can't create a credible vision without honest assessment of your current state.

Identify your aspiration. Where do you want to be in 3–5 years? Not in terms of specific projects or technologies, those will change. In terms of organizational capability and reputation. How do you want customers to experience IT? How do you want your team to feel about working here? What kind of organization do you want to build?

Make it specific. Replace "We will provide excellent service" with "We will have a Net Promoter Score above 40 and response times that meet SLA commitments 95% of the time." Replace "We will have an engaged team" with "We will have engagement scores in the top quartile and voluntary turnover below 10%." The vague version sounds good. The concrete version is measurable.

Specificity makes vision real. It gives you something to measure against. It helps people understand what you're working toward.

Connect it to purpose. Your vision should be in service of your purpose. The vision is the "how", how you'll become the kind of organization that can fulfill your purpose effectively. Make that connection explicit.

Get input from business partners. Your vision shouldn't be created in a vacuum. Involve your leadership team. Get input from staff. Ask key business partners what they need from IT in the future. Vision created collaboratively has more buy-in than vision created in isolation.

Iterate. Your first draft won't be perfect. Share it. Get feedback. Refine it. Test whether it resonates. Keep working it until it feels right, until it's clear, compelling, and connected to what matters.

Values: The Behavioral Foundation

Values are the bridge between purpose/vision and daily behavior. They answer: How do we operate? What principles guide our decisions and actions?

Most organizations have stated values. But stated values and lived values are often very different.

Stated values are what's on your website or in your strategic plan. The words you say matter.

Lived values are what people experience. What behaviors get rewarded? What behaviors get tolerated? What do leaders prioritize when making decisions?

The gap between stated and lived values is where culture breaks down. If you say you value collaboration but reward individual heroics, collaboration isn't really a value, it's just a word. If you say you value transparency but punish people for raising problems, transparency isn't real.

Your job as a leader is to close that gap. To make your stated values real by living them and holding people accountable to them.

Identifying Core Values:

Most organizations have too many values. They list seven or eight because they want to capture everything that matters. But values are most powerful when they're few and memorable.

I recommend 3–5 core values. More than that and people can't remember them. Fewer than that and you probably haven't captured what's most important.

Your core values should be:

Distinctive. They should reflect what's important in your organization, not just generic good things. "Integrity" is important, but it's assumed. What are the values that make your organization unique or that you're specifically trying to build?

Behavioral. You should be able to describe what each value looks like in action. What behaviors reflect this value? What behaviors violate it? If you can't translate a value into observable behavior, it's too abstract.

Tested. Real values are revealed under pressure. When there's a trade-off between speed and quality, which do you choose? When there's tension between customer satisfaction and security, how do you resolve it? Your actual values are what you prioritize when you can't have everything.

One process I've used: gather your leadership team and ask, "What behaviors do we want to see more of in this organization? What behaviors do we want to see less of?" The answers reveal your actual priorities. Then ask: "What values would drive those behaviors?" That's how you identify your real values, not just aspirational ones.

Living Your Values Every Day

Values only matter if they're lived. And living values takes deliberate practice:

Model them yourself. You can't expect your team to live values you don't model. If you say you value transparency, you need to be transparent, about challenges, about decision-making, about mistakes. If you say you value respect, you need to treat people respectfully even under pressure. Your behavior sets the standard.

Back them up with decisions. When making decisions, especially hard ones, explain how your values informed the choice. "We're prioritizing this work because it aligns with our value of customer focus." "We're addressing this performance issue because allowing it to continue would violate our value of accountability." Make the connection explicit.

Recognize them in action. When you see someone living a core value, call it out. Public recognition signals that these values are real and that living them matters. "I want to recognize Sarah for how she handled that difficult customer conversation. That was our value of respect in action."

Address violations directly. When someone's behavior contradicts your values, address it. Don't ignore it because the person is otherwise high-performing or because the conversation will be uncomfortable. Values only matter if they're non-negotiable.

Embed them in processes. Values should show up in hiring decisions (do candidates align with your values?), performance reviews (are people evaluated on living values, not just delivering outcomes?), recognition programs (what behaviors get celebrated?), and even termination decisions (sometimes people need to leave because they can't or won't align with your values).

This is hard work. It's easier to have values on paper and ignore them in practice. But that's worse than having no stated values at all. Because the gap between stated and lived values creates cynicism. People stop believing anything leadership says.

Better to have a few real values that you live than a dozen aspirational values that nobody takes seriously.

Communicating Vision and Purpose: Making It Real

Here's where most organizations fail: they create vision and purpose, present it once or twice, and then assume people will remember and internalize it. They won't.

Vision and purpose only become real through constant, consistent communication. You're not being repetitive. You're finding multiple ways to keep the vision alive and connect daily work to purpose.

Ways to communicate vision and purpose effectively:

Tell stories. Don't just recite your vision statement. Tell stories that illustrate it. Share examples of when the team lived up to the vision. Highlight moments when someone's work directly connected to purpose. Stories make vision concrete and memorable.

Connect daily work to vision. In meetings, when reviewing projects or decisions, make the connection explicit: "This work supports our vision of being seen as a strategic partner." "This improvement directly serves our purpose of enabling better public service." Don't assume people see the connection. Make it explicit.

Use consistent language. When you and your leadership team communicate, use the same language about vision and purpose. Consistency reinforces the message. If everyone's describing the future differently, people get confused.

Revisit regularly. At leadership team meetings, all-staff meetings, one-on-ones, reference your vision and purpose regularly. Not as an agenda item. As context for the work you're discussing. This keeps it present in people's minds.

Make it visible. Put your vision and purpose where people see them. Not just on your website. In your workspace. In presentations. In decision-making frameworks. Make them part of the environment.

Measure progress. If your vision includes specific outcomes (engagement scores, satisfaction ratings, performance metrics), track them and share progress. This shows the vision is operational. You're working toward it and measuring whether you're getting there.

Celebrate milestones. When you achieve something that moves you closer to your vision, acknowledge it. "Remember two years ago when our satisfaction scores were at 65%? We just hit 78%. That's our vision of service excellence becoming real." Celebrating progress signals that the vision is guiding real work.

Leaders need to communicate vision 7–10 times more frequently than feels comfortable to achieve organizational internalization. What feels like over-communication to leaders is often the minimum employees need to understand and align with vision.

Vision Cascade: From Leadership to Front Line

Your leadership team needs to own the vision before it can cascade to the rest of the organization. If your direct reports aren't clear on vision and purpose, or if they don't believe in them, the organization won't either.

That means:

Developing vision with your leadership team, not in isolation. They need to be part of creating it so they have ownership. Their input makes it better and makes sure they're committed to it.

Making sure they can articulate it. Each of your direct reports should be able to explain the vision and purpose in their own words. Not reciting a memorized statement. Really explaining it in a way that clicks with their teams.

Holding them accountable for cascading it. Your leadership team needs to communicate vision and purpose to their teams. They need to connect their area's work to the broader vision. They need to repeat it regularly. This should be an explicit expectation, not something you hope happens organically.

Checking alignment. Periodically ask people throughout the organization: "Can you tell me what our IT department's vision is? Why does your work matter?" Their answers reveal whether vision and purpose are cascading effectively or getting lost in translation.

When vision cascades effectively, everyone in the organization, from senior managers to front-line staff, can articulate where you're going and why it matters. Their daily decisions are informed by that clarity. That's when vision becomes operational, not just aspirational.

When Vision Needs to Evolve

Vision isn't permanent. Organizations change. Context changes. What made sense three years ago might not make sense today.

You should revisit your vision periodically, maybe every 3–5 years, or when significant organizational changes occur. Ask:

- Is this still where we want to go?
- Does this still resonate with our team and business partners?
- Has our context changed in ways that require adjusting our direction?
- Are we making progress toward this vision, or has it become disconnected from reality?

Purpose usually stays more stable. The fundamental reason your work matters doesn't change much. But vision, the specific future state you're building toward, may need to evolve.

When you do adjust vision, be transparent about why. Don't just announce a new vision and expect people to forget the old one. Explain what's changed and why the evolution makes sense. People can handle change. They struggle with unexplained change that feels arbitrary.

What This Means

Vision and purpose aren't soft concepts. They're fundamental to organizational health and performance.

Without clear purpose, work feels meaningless. People show up and do their jobs, but without engagement or energy. Turnover is high because there's nothing keeping talented people there except a paycheck.

Without compelling vision, the organization drifts. People work hard, but without tight coordination. Effort is fragmented. Progress is limited because everyone's pulling in slightly different directions.

With purpose and vision that are real, that are communicated consistently, lived daily, and connected to everything you do, you create something different. You create an organization where people feel their work matters. Where everyone's pulling in the same direction. Where decisions are easier because there's clarity about what you're trying to accomplish.

That's not automatic. That's the result of intentional leadership. Of doing the hard work to discover your purpose, craft your vision, define your values, and then communicate them so consistently that they become part of the organization's DNA.

This work matters. Don't skip it. Don't treat it as a checkbox exercise for your strategic plan. Do it real. Do it well. And then live it every single day.

When this work is real (when it's lived daily and not just written on a wall), people connect to something larger than themselves. Work starts to matter. And your organization builds the cohesion and energy required to accomplish hard things.

That's what vision and purpose create. The difference between organizations that succeed and ones that just survive.

How This Connects to the Broader Framework

Vision and purpose give direction to everything that follows. Without them, governance becomes bureaucracy, structure becomes rigidity, and improvement becomes random activity:

Module 1 (Being a Government IT Leader) provides the prerequisites for vision and purpose work:

- Your personal purpose clarity (Section 1.1) must come before organizational purpose
- Communication skills (Section 1.5) are how vision actually reaches people
- Self-awareness (Section 1.3) helps you recognize when your personal vision is clouding organizational needs

The healthy organization you're building in Module 2 runs on vision and purpose:

- Your leadership team (Section 2.1) must embrace vision before it can cascade
- Organizational structure (Section 2.3) should support your vision

- People development (Section 2.4) aligns with vision, you develop capabilities needed to achieve it
- Culture (Section 2.5) grows from lived values
- Communications (Section 2.6) carries vision and purpose throughout the organization

Module 3: Working on the Right Stuff translates vision into action:

- Governance (Section 3.1) decisions should be evaluated against vision
- Strategic planning (Section 3.2) is how you operationalize vision
- Portfolio management prioritizes work that advances vision

Modules 4 and 5 cannot succeed without vision and purpose. Service excellence requires clarity about what you're trying to deliver and why. Continuous improvement requires a vision of what you're improving toward.

Vision and purpose are the groundwork that makes strategy actionable and operations purposeful.

Key Takeaways

- Purpose answers why your work matters; vision describes where you're going; values guide how you operate
- Compelling vision is clear, concrete, aspirational but achievable, emotionally resonant, and differentiated
- Purpose is usually discovered by connecting technical work to mission impact
- Values only matter if they're lived, stated values without behavioral follow-through create cynicism
- Vision requires constant communication (7–10x more than feels comfortable) to internalize
- Leadership team must own vision before it can cascade to the organization
- Vision and purpose transform empty activity into work that matters

Reflection Questions

Assess your vision and purpose clarity:

1. Can every member of your team articulate why their work matters beyond "keeping systems running"?
2. Do you have a clear vision statement that people can remember and explain in their own words?
3. How often do you explicitly connect daily work to purpose and vision in your communications?
4. Are your stated values lived, or is there a gap between what you say and what you reward?
5. When was the last time you told a story that illustrated your purpose or vision in action?

6. Does your leadership team communicate vision and purpose consistently, or does each person describe it differently?
7. Can you describe your organization's vision in concrete, measurable terms?

The working documents for this section are in Appendix A.2.2.

Section 2.3

Organizational Structure

The same problem kept showing up at a mid-sized municipality: work was falling through the cracks. Projects that should have been coordinated weren't. Decisions that needed to be made were getting stuck. People were duplicating effort because they didn't know someone else was working on the same thing.

The problem wasn't that people were lazy or incompetent. The problem was structural. They had unclear roles. Ambiguous authority. No clear decision-making process for issues that crossed functional areas. People didn't know who was responsible for what, so either everyone jumped in (creating chaos) or no one jumped in (creating gaps).

The CIO kept trying to solve this through better communication. More meetings. More status updates. More coordination. But he was treating the symptom, not the disease.

The disease was that their organizational structure didn't match the work they needed to do. They were organized around technology silos (infrastructure, applications, support) but most of their important work crossed those boundaries. And they had no structural way to manage that cross-functional work effectively.

Once he realized this, things changed. They didn't need more meetings. They needed better structure. Clear roles. Defined authority. Explicit decision-making processes. Mechanisms for cross-functional coordination.

When they fixed the structure, the problems largely solved themselves. Not because people suddenly got smarter or worked harder. Because the structure enabled them to work effectively instead of fighting against organizational confusion.

This section focuses on building organizational structure that enables effectiveness rather than creating friction.

Why Structure Matters

Let me state something that sounds obvious but gets ignored constantly: structure determines how work flows through your organization. Good structure enables good work. Bad structure creates dysfunction no matter how talented your people are.

Structure includes:

- **Roles and responsibilities:** Who does what? What is each person accountable for?
- **Authority and decision rights:** Who can make which decisions? Where does authority reside?
- **Reporting relationships:** Who reports to whom? How does information flow up and down?
- **Coordination mechanisms:** How do different parts of the organization work together on cross-functional issues?
- **Spans of control:** How many people report to each manager? Is it manageable?

When these elements are clear and well-designed, people can do their work without constant confusion about who's responsible, who has authority, or how decisions get made. When these elements are unclear or poorly designed, you get:

- Duplicated effort because people don't know someone else is handling something
- Dropped work because everyone assumes someone else is responsible
- Slow decisions because authority is ambiguous
- Conflict at boundaries where roles overlap or have gaps
- Frustration from staff who don't know who to go to for decisions
- Managers overwhelmed because their span of control is too large

Most CIOs inherit an organizational structure. They don't question it. They assume it's just how things are. But structure is a design choice. And if your current structure isn't enabling your organization to work effectively, you can change it.

The evidence on organizational design confirms it. McKinsey's ongoing organizational health research consistently finds that structural clarity (clear roles, decision rights, and accountability) is among the strongest predictors of organizational effectiveness. Organizations with clear structure outperform peers on growth, innovation, and employee productivity. In government specifically, where reporting lines often reflect political compromise rather than operational logic, getting structure aligned to strategy is even more critical.

Matching Structure to Strategy and Work

The fundamental principle: your organizational structure should enable your strategy and support the actual work you need to do.

If your strategy requires innovation and rapid response, you need a structure that enables agility, not layers of approval and rigid functional silos.

If your work requires close coordination across technical areas, you need structural mechanisms for that coordination, not just hoping people will collaborate organically.

If your vision is to be a strategic partner to the organization, your structure should create roles and mechanisms for strategic engagement, not just operational delivery.

Most IT organizations in local government are structured functionally: infrastructure, applications, support, security. There are reasons for this. People with similar expertise work together. You can develop deep technical capability within each function.

But this structure has limitations:

It creates silos. Each function optimizes for its own area. Cross-functional work is harder because it requires coordination across boundaries.

It can obscure customer relationships. Who owns the relationship with a particular department? If infrastructure, applications, and support all interact with them separately, the customer experience can be fragmented.

It can delay decisions. Issues that cut across functions require coordination among multiple managers. This takes time and can create gridlock.

It can make accountability ambiguous. When work crosses functions, who's ultimately responsible? In a purely functional structure, this is often unclear.

Functional structures aren't wrong. They have trade-offs. And you need to be deliberate about whether your structure is serving your strategy and work, or working against them.

Common Structural Models

Consider the typical structural approaches for government IT organizations and their trade-offs:

1. Functional Structure (Most Common)

Organization chart:

CIO

- Infrastructure Manager
- Applications Manager
- Support/Help Desk Manager
- Security Manager (or embedded in infrastructure)

Strengths:

- Clear technical specialization and expertise development
- Efficient use of resources within functions
- Clear career paths within technical domains
- Straightforward for small teams

Weaknesses:

- Creates silos that inhibit collaboration
- Cross-functional work requires constant coordination
- Customer relationships can be fragmented
- Accountability for outcomes (vs. technical outputs) is unclear

Best for: Smaller IT departments where the benefits of specialization outweigh coordination costs.

2. Hybrid Functional/Customer Structure

Organization chart:

- CIO
    - IT Operations Manager (infrastructure, support, security)
    - IT Applications Manager (development, integration, platforms)
    - Customer Relationship Manager(s) (aligned to major departments)

Strengths:

- Maintains technical depth through functional grouping
- Creates clear customer ownership
- Enables strategic engagement with business partners
- Balances internal efficiency with external responsiveness

Weaknesses:

- Customer relationship managers need strong facilitation skills
- Potential for conflict between customer demands and operational constraints
- Requires mature coordination between customer-facing and technical functions
- Can be confusing if roles aren't crystal clear

Best for: Mid-sized IT departments needing stronger business partner engagement while maintaining technical expertise.

3. Service-Based Structure

Organization chart:

- CIO
    - Service Delivery Manager (end-user services, support, desktop)
    - Infrastructure Services Manager (networks, servers, cloud, security)
    - Application Services Manager (enterprise apps, integrations, development)

Strengths:

- Organized around service delivery rather than just technical domains

- Clear accountability for service outcomes
- Aligns to ITIL/ITSM frameworks naturally
- Manages service catalog and SLA management

Weaknesses:

- May still create functional silos, just renamed
- Requires mature service management capability
- Can be confusing to customers who just see "IT"
- May not address strategic engagement gaps

Best for: Organizations implementing ITIL/service management frameworks who want structure to support service orientation.

4. Matrix Structure (Rare in Local Government IT)

Dual reporting: functional managers plus project/program managers.

Strengths:

- Balances functional expertise with cross-functional project work
- Flexible resource allocation
- Strong for project-intensive organizations

Weaknesses:

- Complex dual reporting creates confusion
- Requires sophisticated management capability
- Can create conflict between functional and project priorities
- Too heavy for most local government IT departments

Best for: Larger IT departments with significant project portfolios and mature project management capability. Usually too complex for mid-sized local government IT.

The Structure I Recommend for Most Mid-Sized IT Departments

Based on years of observing what works, here's what I recommend for most mid-sized local government IT departments (15–75 staff):

A hybrid functional structure with clear coordination mechanisms.

It means:

Maintain functional groupings for technical work (infrastructure, applications, support). This preserves technical depth and efficiency.

Add explicit coordination roles or mechanisms for cross-functional work. This might be:

- A designated lead for major initiatives that cut across functions
- Regular cross-functional coordination meetings for ongoing work
- Clear escalation paths for issues that span boundaries

- Service delivery managers or relationship managers for major business partners

Clarify decision authority at each level. Define what decisions managers can make autonomously, what requires CIO approval, and what requires cross-functional coordination.

Create clear accountability for outcomes, not just technical outputs. Someone needs to own customer satisfaction, project delivery, service quality, even when the work crosses functional areas.

This is a critical principle:

Authority must match accountability. If you hold someone accountable for an outcome, they must have the authority to make the decisions necessary to achieve it. Too often, we assign accountability without corresponding authority, then blame people when they can't deliver. If a service delivery manager owns customer satisfaction, they need authority to coordinate work across functions. If a project lead owns delivery, they need authority to convene resources and make decisions. Structure should enable accountability, not create accountability without power.

This structure gives you the benefits of functional specialization while addressing the coordination and accountability gaps that purely functional structures create.

Roles and Responsibilities: Getting Crystal Clear

Ambiguous roles are one of the most common sources of organizational dysfunction. People waste time and energy figuring out who should do what. Work falls through cracks. Conflicts emerge over territory. Decisions stall because no one knows who has authority.

Your job is to make roles and responsibilities crystal clear.

For each position in your organization, document:

Primary responsibilities: What is this role accountable for delivering? What outcomes does this person own?

Key activities: What does this role do day-to-day? Be specific enough that someone new to the role could understand what's expected.

Decision authority: What decisions can this role make autonomously? What requires approval from above? What requires coordination with peers?

Interfaces: Who does this role work with regularly? What's the nature of those relationships? (Provides service to, collaborates with, escalates to, etc.)

Reporting relationship: Who does this person report to? Who reports to them?

Call it bureaucracy if you want. It's clarity. When roles are clear, people can do their jobs without constant checking and second-guessing.

One simple practice: for any recurring problem or conflict in your organization, ask "Is this a people problem or a structure problem?" Often what looks like a people

problem (someone isn't doing their job, people aren't collaborating) is a structure problem (unclear roles, ambiguous authority, missing coordination mechanisms).

Fix the structure, and the people problem often resolves itself.

RACI Matrix: A Practical Tool

One tool that's actually useful: the RACI matrix. For major processes or initiatives that cross functional boundaries, create a RACI that defines:

- **R = Responsible:** Who does the work?
- **A = Accountable:** Who owns the outcome? (Only one person can be accountable)
- **C = Consulted:** Who provides input?
- **I = Informed:** Who needs to know?

The RACI makes explicit who's responsible for what at each stage. It prevents gaps and overlaps. It creates accountability.

Don't create RACIs for everything, that becomes bureaucratic. But for major cross-functional work, this tool provides clarity that prevents a lot of organizational friction.

Decision Authority: Who Decides What?

Decision-making authority is often the most ambiguous aspect of organizational structure. People don't know what decisions they can make on their own, what requires approval, and what needs to be coordinated with others.

The result is two problems:

Over-escalation: People bring decisions to you that they should be making themselves. It creates bottlenecks and prevents people from developing decision-making capability.

Under-escalation: People make decisions that should have been escalated or coordinated. You end up with problems when their decisions affect others or have organizational implications they didn't consider.

The solution is to be explicit about decision authority at each level.

A framework that works:

Level 1 Decisions (Front-line staff): Routine operational decisions within clear parameters. Examples: scheduling their work, triaging tickets, applying standard procedures. **Authority:** Autonomous within policy/procedure.

Level 2 Decisions (Supervisors/Team Leads): Tactical decisions affecting their team or work area. Examples: work assignments, minor process improvements, handling most customer issues. **Authority:** Autonomous within budget and policy; inform manager.

Level 3 Decisions (Managers): Strategic decisions affecting their functional area. Examples: staffing decisions, functional strategies, significant budget requests, vendor selections. **Authority:** Some autonomous; some require CIO approval depending on impact/cost.

Level 4 Decisions (CIO): Organizational-level decisions with broad impact. Examples: organizational structure, major initiatives, enterprise architecture, policy changes. **Authority:** Autonomous within delegation from above; may require approval from county executive/board.

Cross-functional decisions: Issues affecting multiple areas. Examples: changes to shared systems, process changes affecting multiple functions, resource allocation across teams. **Authority:** Requires coordination among affected managers; CIO decides if managers can't reach agreement.

Document this framework. Train your team on it. Then trust people to make decisions at the appropriate level, and hold them accountable for making those decisions well.

The principle of matching authority to accountability becomes operational here. You cannot hold people accountable for outcomes if they lack authority to make the decisions that affect those outcomes. Conversely, giving people decision authority without corresponding accountability creates chaos, decisions get made without ownership of results.

The most common failure in organizational design is assigning accountability without authority. We tell managers they own service quality but require them to get approval for every decision that affects quality. We hold team leads accountable for project delivery but don't give them authority to prioritize work or allocate resources. The result is frustration, bottlenecks, and failure.

When decision authority is clear, decisions happen faster, at the right level, with appropriate input. When it's ambiguous, everything slows down and people either make decisions they shouldn't or abdicate decisions they should make.

Clear decision rights improve both speed and quality of decisions. When people know who has authority, decisions don't stall in committee, and the people closest to the work can act without waiting for permission they don't need. Beyond speed, clear decision authority increases employee engagement and reduces frustration with organizational bureaucracy.

Span of Control: Finding the Right Balance

Span of control refers to how many people report directly to a manager. Too wide a span and managers can't provide adequate supervision, coaching, and support. Too narrow and you create unnecessary layers and management overhead.

For most local government IT organizations, here are reasonable guidelines:

CIO span of control: 4–7 direct reports is typical. Fewer than 4 and you might have unnecessary management layers or insufficiently trusted managers. More than 8 and you likely can't build strong relationships and provide adequate coaching.

Manager span of control: 5–12 direct reports depending on work complexity and geographic distribution.

- For routine work with minimal variability: up to 12 reports is manageable
- For complex work requiring significant coaching: 5–7 is better

- For geographically distributed teams: smaller spans because coordination is harder

Lead/Supervisor span of control: 5–15 depending on work type and required supervision level.

If your spans are significantly outside these ranges, that's a signal your structure may need adjustment.

Too narrow: You might have more management layers than needed. This increases overhead, slows decisions, and limits individual contributor growth opportunities.

Too wide: Managers become overwhelmed, can't provide adequate coaching and supervision, and start operating transactionally rather than strategically.

The key question: Can each manager provide adequate support to their direct reports? If not, the span is too wide.

Coordination Mechanisms: Enabling Cross-Functional Collaboration

Even with clear roles and reporting relationships, you need explicit mechanisms for coordinating cross-functional work. Don't assume it will happen organically. It won't.

Effective coordination mechanisms include:

Regular cross-functional meetings. Your leadership team meeting is one example. For major initiatives, you might create specific coordination forums, a steering committee, a working group, a project team, with clear membership and mandate.

Initiative leads or project managers. For significant cross-functional work, designate someone to coordinate across functions. Give them explicit authority to convene people, make certain decisions, and escalate issues. Make clear they're coordinating, not controlling, functional managers still own their areas, but the initiative lead makes sure coordination happens.

Clear escalation paths. Define how issues that cross boundaries get escalated and resolved. Don't let them languish in nobody's land. Have a clear process: if functional managers can't resolve a cross-functional issue, it escalates to the CIO or a designated forum.

Shared metrics or goals. When managers have shared accountability for outcomes (not just their functional outputs), coordination improves naturally. They have incentive to work together because they're measured on collective success. This is another application of matching authority to accountability: if multiple managers share accountability for an outcome, they need shared authority to coordinate the work. Don't create shared accountability without creating the coordination mechanisms and decision-making authority to enable it.

Communication tools and protocols. Simple things like shared project boards, regular status updates, or designated channels for cross-functional issues can sharply improve coordination.

Be deliberate about it. Cross-functional coordination is hard. If you don't build mechanisms to enable it, it either won't happen or will happen inefficiently through ad-hoc conversations and meetings.

When to Reorganize (and When Not To)

Reorganization is disruptive. It creates uncertainty. It interrupts workflow. It takes months for people to adjust to new structures and relationships. Don't reorganize lightly.

Consider reorganization when:

Your current structure is actively preventing you from achieving your strategy. If you've set a strategic direction but your structure makes that strategy impossible to execute, structural change might be necessary.

You've grown or shrunk significantly and spans of control are now inappropriate. Growth might require adding management layers. Shrinkage might require removing them or consolidating functions.

You have chronic dysfunction at functional boundaries that can't be solved through better coordination. Sometimes the only solution is to restructure so the work that needs to be done together lives within one organizational unit.

You're implementing a major change in service delivery model (e.g., moving from project-based to service-based) and structure needs to align.

Avoid reorganization when:

You're trying to solve people problems through structural changes.

If the problem is that certain individuals aren't performing, replacing them or developing them is more effective than reorganizing around them.

You're responding to a temporary situation or short-term pressure.

Structure should be relatively stable. Don't reorganize for temporary circumstances.

You haven't exhausted other options. Before reorganizing, try improving coordination, clarifying roles, or adjusting processes. Structure should be the last resort, not the first response.

You're reorganizing frequently. If you reorganize every 1–2 years, you're creating constant instability. Good structure should be stable for at least 3–5 years unless major circumstances change.

When you do reorganize, be transparent about why. Explain what problem you're solving and how the new structure addresses it. Give people time to adjust. Provide support during the transition. And recognize that productivity will temporarily decline as people adapt.

Organizational Structure for Different Sizes

One size doesn't fit all. Your organizational structure should match your department's size and complexity:

Very Small (5–10 staff):

- Flat structure: CIO with all or most staff as direct reports
- Minimal formal hierarchy
- Roles may be combined (e.g., one person handling both infrastructure and security)
- Coordination happens naturally due to small size
- Focus on clarity of roles more than formal structure

Small (11–20 staff):

- CIO with 3–5 functional managers
- One level of hierarchy below managers (leads or senior staff)
- Beginning to specialize roles
- Some formal coordination needed for cross-functional work
- Can still operate relatively informally with good communication

Mid-Sized (21–40 staff):

- CIO with 4–7 managers covering major functions
- 1–2 levels below managers
- Specialized roles in most areas
- Formal coordination mechanisms essential
- Need explicit structure for cross-functional work
- Beginning to need governance structures

Larger (40+ staff):

- Multiple levels of management
- Potential for deputy CIO or chief technology officer roles
- Specialized teams within functions
- May need matrix elements for major initiatives
- Formal coordination and governance essential
- Risk of silos and bureaucracy without deliberate coordination

Making Your Current Structure Work Better

Even if you're not ready to reorganize, you can make your current structure work better:

Document it clearly. Create an org chart. Define roles. Make decision authority explicit. Publish it so everyone knows how the organization works.

Address gaps and overlaps. Where is work falling through cracks? Where are people duplicating effort or conflicting over territory? Fix these specifically through role clarification or coordination mechanisms.

Strengthen coordination for cross-functional work. Add coordination meetings, designate initiative leads, create shared goals, whatever helps different parts of your organization work together more smoothly.

Enable appropriate decision-making. Push decisions down to the right level. Stop making decisions your managers should make. Encourage your managers to trust their teams.

Reduce unnecessary hierarchy. If you have management layers that don't add value, flatten the structure. Wider spans with fewer layers often work better than narrow spans with multiple layers.

Create flexibility within structure. Your structure doesn't have to be rigid. People can wear multiple hats. Teams can be temporarily reconfigured for major initiatives. But the baseline structure should be clear.

The goal isn't perfect structure. The goal is structure that enables your organization to do its work without creating unnecessary friction or ambiguity.

What Structure Comes Down To

Organizational structure is not something that just happens. It's a design choice. And that design either enables your organization to work effectively or creates dysfunction that even talented people can't overcome.

Your job as CIO is to make sure your structure:

- Aligns with your strategy and the work you need to do
- Provides clear roles, responsibilities, and decision authority
- Has appropriate spans of control for effective management
- Includes mechanisms for coordinating cross-functional work
- Enables rather than impedes the work people need to do

Don't accept dysfunction created by poor structure. If work is falling through cracks, if coordination is consistently difficult, if decision-making is chronically slow, those are structure problems. Fix the structure.

You don't need constant reorganization. It requires deliberate design. Clear documentation. Thoughtful adjustment when needed. And recognition that structure is a tool for enabling organizational effectiveness, nothing more, nothing less.

Sound structure makes everything else easier. Poor structure means fighting organizational friction forever.

How This Connects to the Broader Framework

Structure determines how work gets done, who makes decisions, and how information flows. When structure is unclear, every other element of organizational health struggles:

Your Module 1 leadership skills shape how you approach structure:

- Your purpose clarity (Section 1.1) keeps structural decisions anchored to what the organization actually needs
- Political navigation (Section 1.4) gets you through the politics of reorganization
- Communication (Section 1.5) makes or breaks how structural changes land

Organizational health (Module 2) rises or falls on getting structure right:

- Your leadership team (Section 2.1) operates within the structure you create
- Vision (Section 2.2) should guide structural decisions
- People development (Section 2.4) happens through reporting relationships and career paths defined by structure
- Culture (Section 2.5) is shaped by whether structure enables or frustrates effective work
- Communications (Section 2.6) flow through structural channels

Module 3's governance and planning work needs structure that supports strategy:

- Governance (Section 3.1) structure should align with organizational structure
- Strategic planning (Section 3.2) may require structural adjustments to execute
- Service delivery structure should match your service portfolio

Poor structure creates friction everywhere. Clear structure lets people focus on doing the work instead of fighting the org chart.

Key Takeaways

- Structure determines how work flows; good structure enables effectiveness, poor structure creates friction
- Match structure to strategy and actual work, not just historical patterns
- Functional structures work in leaner organizations but require coordination mechanisms as you grow
- Clear roles, decision authority, and accountability are more important than perfect org charts
- Span of control matters: 4–7 for CIO, 5–12 for managers depending on work complexity
- Cross-functional work needs explicit coordination mechanisms; it won't happen organically
- Reorganize only when necessary; structural stability is valuable
- Document structure clearly so everyone understands how the organization works

Reflection Questions

Assess your organizational structure:

1. Does your current structure enable or impede the work you need to do?
2. Are roles and responsibilities clear enough that people know what they own?
3. Is decision authority explicit, or do people constantly check before making decisions?
4. Are spans of control appropriate for effective management and coaching?
5. When work crosses functional boundaries, do you have effective coordination mechanisms?
6. How much work is falling through cracks or being duplicated due to structural ambiguity?
7. If you reorganized tomorrow, what problem would you be solving?

The working documents for this section are in Appendix A.2.3.

Section 2.4

Capabilities and People

About five years into the role, a colleague was reviewing staffing when something struck them: they had basically the same people in the same roles doing the same work as when they'd started. A few people had left and been replaced. A few had been promoted. But the organizational capability hadn't changed.

And the challenges had changed significantly. Technology was more complex. Cybersecurity threats were more sophisticated. Business partner expectations were higher. The work was harder. But the team's capabilities were largely the same as they'd been five years earlier.

This wasn't the team's fault. The organization hadn't invested in developing them. They hadn't created clear career paths. They hadn't been deliberate about building the capabilities needed for the future. They'd just been filling positions and hoping people would figure it out.

That realization was uncomfortable. Because it meant they were asking people to solve tomorrow's problems with yesterday's capabilities. And that wasn't sustainable.

The CIO made a commitment that day: the organization would get serious about capability development. They would invest in their people. Create career paths. Build the organization's capacity to handle increasing complexity. Stop just filling positions and start building capability.

That shift drove significant change. Not overnight. But over time, it transformed the organization's capability to handle complex challenges, adapt to change, and deliver value. Because they stopped treating people as static resources and started treating them as developing capabilities.

This section tackles that challenge head-on.

Why Capability Development Matters

Your organization is only as strong as the people in it, and that's especially true in local government IT, where deep bench strength is a luxury you probably don't have. You can't just throw more resources at problems. So you maximize the capability of the people you've got.

Many CIOs miss this point: capability isn't static. People either grow or stagnate. They either develop new skills and increase their value to the organization, or they plateau and become increasingly mismatched to the work that needs doing.

Your job is to create an environment where people grow. Where they build new capabilities. Where they develop into more valuable contributors. That isn't altruism. This is strategic necessity.

Investing in capability development:

Increases organizational capacity to handle complexity. As technology becomes more complex and challenges harder, you need people who can handle that complexity. Development is how you build that capability.

Improves retention of high performers. Talented people leave when they stop growing. Development opportunities are one of the strongest predictors of retention, stronger than compensation in many cases.

Creates succession and continuity. When you develop people's capabilities, you build bench strength. You have people ready to step into new roles when positions open. You're not hostage to any individual person.

Builds engagement and motivation. People want to grow. When you invest in their development, they're more engaged, more committed, and more willing to contribute discretionary effort.

Reduces dependency on external hires. If you can develop capability internally, you're not always recruiting externally. You're building from within. This is often faster, cheaper, and creates better cultural fit.

Improves organizational resilience. Teams with diverse, growing capabilities adapt better to change. They can handle unexpected challenges. They're more flexible.

Yet despite these benefits, most IT organizations under-invest in capability development. Why? Because it takes time. Because it requires ongoing attention. Because the benefits are medium-term rather than immediate. Because operational urgency crowds out developmental work.

But this is short-term thinking that creates long-term problems. If you're not deliberately developing capability, your organization is slowly becoming less able to handle the challenges you face.

Organizations that invest meaningfully in training and development consistently show higher productivity, better retention, and stronger employee satisfaction. For government organizations, development investment is among the strongest predictors of organizational performance alongside leadership quality.

The Capability Development Framework

Developing organizational capability requires systematic attention to four areas:

1. Recruiting the right people

2. Developing capabilities throughout careers

3. Managing performance effectively

4. Creating clear career paths and succession

Let's address each area.

1. Recruiting the Right People: Starting with the Foundation

Everything starts with getting the right people. You can develop people, but you can't develop someone who lacks basic capability or cultural fit.

Recruiting well means:

Clarity about what you need. Before you post a position, be crystal clear: What capabilities does this role require? What will this person do? What outcomes are they responsible for? What cultural attributes matter for success here?

Don't just use generic IT job descriptions. Think specifically about your organization's context and needs. A network administrator position in a large IT department is different from a network administrator who'll be the only infrastructure person in a small team. Define what you need.

Assessing for both technical capability and cultural fit. Technical skills are table stakes. But cultural fit, whether someone will thrive in your environment and align with your values, is equally important. Someone who's technically brilliant but culturally misaligned will struggle and potentially disrupt your team.

During interviews, assess:

- Technical capability (through technical interviews, practical exercises, reference checks)
- Problem-solving approach (through scenario-based questions)
- Communication skills (through how they explain complex topics)
- Cultural alignment (through behavioral questions about how they handle challenges, collaborate, etc.)
- Learning orientation (through questions about how they stay current, what they're learning)

Looking for potential, not just current capability. Especially for more junior roles, hire for potential and learning orientation, not just current skill. Someone who's curious, adaptable, and eager to learn will often outperform someone with more current skills but less growth mindset.

Moving quickly on strong candidates. In government, hiring processes are often slow. This means you lose strong candidates to other employers. Simplify your process as much as possible. When you find someone great, move quickly. Don't let bureaucracy cost you excellent people.

Being realistic about compensation. Government salaries are often below private sector. You can't always compete on compensation. But you can compete on other factors: mission, work-life balance, stability, benefits, development opportunities. Be clear about your value proposition. Don't overpromise. But don't undersell what you offer either.

Involving your team in hiring. The people who'll work with a new hire should have input into the decision. They often spot red flags or strengths that managers miss. And their involvement creates buy-in, they're more invested in helping the new person succeed if they were part of choosing them.

One practice I used: every hire goes through at least two rounds of interviews. First round is screening for basic capability and fit. Second round includes a technical exercise or presentation and meetings with multiple team members. This slows the process slightly but markedly improves hiring quality.

2. Developing Capabilities: The Ongoing Work

Once you have people, your job is to continuously develop their capabilities. This happens through multiple mechanisms:

Formal training and education. Send people to conferences, workshops, certification programs. Support them pursuing degrees or certifications relevant to their work. Budget for training. Make it clear that professional development is expected and supported.

How much should you budget? A reasonable target is $1,500–3,000 per person per year for professional development, adjusted for role and organizational budget. This might feel like a lot, but the ROI on developing your people far exceeds the cost.

On-the-job learning. Most capability development happens through work, not formal training. Give people challenging assignments that stretch their capabilities. Let them lead projects. Expose them to business partner interactions. Create opportunities to work on cross-functional initiatives.

Be explicit about it: "I'm giving you this assignment because it's an opportunity to develop your project management skills" rather than just "Here's your next task."

Mentoring and coaching. This is where your one-on-ones matter. Use them for coaching conversations. Help people think through challenges. Ask questions that develop their thinking rather than just providing answers. Connect them with mentors inside or outside the organization.

Create a mentoring culture where senior staff see developing junior staff as part of their role, not an extra burden.

Knowledge sharing within the team. Create opportunities for people to learn from each other. Brown bag lunch sessions where people present on topics. Documentation of solutions and approaches. Pair programming or shadowing opportunities. Cross-training so people develop capabilities in multiple areas.

Stretch assignments and special projects. Don't always give work to the person who can do it most easily. Sometimes give work to the person who'll grow from doing it. Yes, it will take longer. Yes, they'll need support. But that's how they develop capability.

Create a pipeline of special projects, task forces, or temporary assignments that expose people to new areas. Someone in infrastructure working on an application project. Someone in support leading a security initiative. People develop breadth of capability and silos start to break down.

External communities and networking. Encourage people to participate in professional associations, user groups, local government IT networks. These connections expose them to different approaches, best practices, and peer learning. Support their participation through time and funding.

Learning from failure. When projects don't go as planned or mistakes happen, treat them as learning opportunities. Conduct blameless post-mortems. Ask "What did we learn?" rather than "Who screwed up?" Create psychological safety for people to admit mistakes and learn from them.

This is cultural. If people fear admitting errors, they'll hide them and miss the learning opportunity. If they know mistakes are learning experiences (within reason), they'll be open about them.

The 70-20-10 Learning Model provides a useful framework: approximately 70% of learning happens through challenging work experiences, 20% through relationships and coaching, and 10% through formal training. Your development approach should mirror this, most development happens through work, supported by coaching, supplemented by training.

3. Managing Performance: The Foundation of Accountability

Performance management gets a bad reputation as bureaucratic, punitive, and performative. In practice it's a developmental tool. It's how you create clarity about expectations, provide feedback that helps people improve, and hold people accountable for results.

Effective performance management includes:

Clear expectations and goals. At the beginning of each performance cycle, people need clarity about:

- What outcomes they're responsible for
- What success looks like
- How their work contributes to organizational goals
- What competencies they should be developing

Don't make this a one-way conversation. Develop goals collaboratively. People are more committed to goals they helped create.

Regular feedback, not just annual reviews. The annual performance review should contain no surprises. If you're providing regular feedback through one-on-

ones and in-the-moment coaching, the annual review is just a summary and formalization.

Give both positive feedback (recognition of what's going well) and developmental feedback (areas for improvement). Both matter. People need to know their strengths and where to focus development effort.

Employees receiving frequent feedback (weekly or bi-weekly) show meaningfully higher performance and engagement than those receiving feedback only during annual reviews.

Documentation of performance issues. When someone isn't meeting expectations, document it. This isn't punitive. It's clarity. People need to understand specifically what's not working and what needs to change. Documentation also protects you if performance issues eventually lead to separation, HR will require it.

Recognition of strong performance. Don't just address problems. Actively recognize and celebrate excellent work. Public recognition in team meetings. Awards or bonuses if available. Simply saying "You did outstanding work on that project" in a one-on-one. Recognition signals what good performance looks like and motivates continued excellence.

Developmental conversations about career trajectory. Performance reviews should include forward-looking discussion: Where does this person want to grow? What capabilities do they want to develop? What opportunities can we create? How can we support their career development?

Differentiation between high and low performers. Not everyone performs at the same level. Acknowledge this. Your high performers should receive more development opportunities, more recognition, faster advancement. Your low performers should receive clear feedback and support to improve, and consequences if they don't.

Treating everyone the same, even when performance differs significantly, creates two problems: high performers feel unrecognized and may leave; low performers don't face accountability to improve.

Addressing performance problems directly. When someone consistently isn't meeting expectations despite feedback and support, you have two obligations: to the individual (clarity about whether they have a future in the role) and to the team (who's affected by poor performance).

Have the hard conversation. Be clear about what needs to change. Set a timeline. Provide support. But if improvement doesn't happen, don't let it drag on indefinitely. Sometimes the kindest thing is helping someone understand this isn't the right fit and supporting their transition elsewhere.

Many managers avoid performance conversations because they're uncomfortable. But avoiding them is unfair to everyone, the struggling employee doesn't get clarity, the team carries extra burden, and the organization suffers from underperformance.

4. Career Paths and Succession: Building the Future

People want to understand how they can grow in your organization. What's the way forward? What does progression look like? If they develop capabilities and perform well, what opportunities exist?

Many IT organizations, especially smaller ones, don't have clear career paths. People plateau because there's nowhere to grow. Your best technician becomes your manager by default because that's the only "up" available. And then you lose a great technician and gain a mediocre manager who didn't really want the job.

Creating career paths means:

Defining multiple paths to advancement. Not everyone wants to manage. Create technical tracks and management tracks. Someone can advance and earn more as a senior technical expert without becoming a manager. Or they can move into management if that aligns with their interests and capabilities.

Example progression paths:

Technical Track:

- IT Technician I, II, III
- Senior Systems Administrator
- Principal Engineer or Architect
- Technical Fellow (for organizations large enough)

Management Track:

- Team Lead
- Supervisor
- Manager
- Senior Manager or Director

Specialist Track:

- Security Analyst, Senior Security Analyst, Security Architect
- Business Analyst, Senior Business Analyst, Solution Architect

Each level should have clear criteria: What capabilities are required? What scope of responsibility? What's the expected impact?

Making progression based on capability and contribution, not just time. Some people advance quickly because they're developing rapidly and contributing at higher levels. Others advance more slowly. That's fair. What's unfair is lockstep advancement based only on tenure.

Be clear about what it takes to advance. If someone wants to move to the next level, they should understand exactly what capabilities and contributions are required. Then it's their choice whether to develop in that direction.

Succession planning for key roles. For every critical role in your organization, you should have answers to:

- If this person left tomorrow, who could step in?
- Who could be ready in 12–24 months with development?
- What development do they need to be ready?
- What's our plan to build that capability?

Don't wait until someone announces they're leaving to think about succession. By then it's too late to develop someone properly. Succession planning happens early, not after the fact.

Creating development opportunities that prepare people for next roles. If someone aspires to management, give them opportunities to lead projects, mentor junior staff, participate in decision-making. If someone wants to be a senior technical expert, give them complex technical problems, opportunities to design solutions, chances to guide others technically.

Being honest about limitations. Small organizations have limited advancement opportunities. If you have 25 staff, you're not creating 10 new management positions. Be honest: "Here are the realistic paths in our organization. If your goal requires more opportunities than we have, I support you pursuing that elsewhere, and I'll help you get there."

This honesty builds trust. People appreciate clarity even when it's not what they hoped. And sometimes they'll stay anyway because other factors (mission, flexibility, relationships) matter more than title advancement.

Supporting internal mobility. When opportunities arise, look first to develop and promote from within. This sends a message that development is real and leads somewhere. External hires should be the exception (for specialized needs or when internal candidates aren't ready) not the default.

Organizations with clear career paths retain talent far better than those without them.

Building a Learning Culture

Beyond formal development programs, you need a culture that values continuous learning. Where people are expected to stay current. Where learning is seen as part of the job, not something you do on your own time if you feel like it.

Creating a learning culture means:

Modeling continuous learning yourself. Talk about what you're learning. Share articles or insights. Admit when you don't know something and need to learn. Take courses. Your behavior signals what's valued.

Providing time for learning. Don't expect people to develop capabilities entirely on their own time. Build learning time into work expectations. Maybe it's dedicated Friday afternoons. Maybe it's an expectation that everyone dedicates X hours per month to professional development. Make it explicit that learning is part of work.

Celebrating learning and application of new knowledge. When someone implements a new approach they learned at a conference, recognize it. When someone shares knowledge with the team, appreciate it. What gets recognized gets repeated.

Creating psychological safety for not knowing. In many technical organizations, there's pressure to be the expert, to have all the answers. This discourages admitting you need to learn something. Create space for people to say "I don't know, but I'll figure it out" without judgment.

Making knowledge sharing expected. When people attend training or conferences, have them share key takeaways with the team. When someone solves a complex problem, have them document the approach. Create regular forums for knowledge sharing.

Staying current with technology and methods. The technology environment changes constantly. What was current five years ago is outdated today. Your organization needs to continuously absorb new knowledge, methods, and technologies. This doesn't happen automatically. It requires deliberate investment in learning.

The Special Challenge of Technical Debt in Capabilities

Just as systems accumulate technical debt when you defer necessary updates, organizations accumulate capability debt when you defer necessary development. Your people's skills become outdated. Your approaches fall behind best practices. The gap between what you need and what you have widens.

This capability debt becomes a crisis when:

- Key people leave and you realize no one else knows how to do their work
- New technologies or threats emerge and no one has the skills to address them
- You want to pursue strategic initiatives but lack necessary capability
- Business expectations rise but your team's capability hasn't

Paying down capability debt requires ongoing investment. You can't fix years of under-investment in one training cycle. But you can commit to continuous development that prevents the debt from growing and gradually closes the gap.

Dealing with Performance Challenges

Not everyone will develop at the pace you need. Some people will plateau. Some will struggle despite support. Part of managing capabilities is addressing when people aren't meeting expectations.

When someone isn't developing adequately:

First, get clarity. Are expectations clear? Does the person understand what's required? Have you provided adequate feedback? Sometimes what looks like performance failure is communication failure.

Second, provide support. What resources, training, or coaching could help? What obstacles are preventing improvement? Try to set them up for success.

Third, set clear timeline and expectations. "Here's specifically what needs to improve. Here's the timeline for improvement. Here's the support I'm providing. If we don't see improvement within this timeline, we'll need to discuss whether this role is the right fit."

Fourth, follow through. If improvement doesn't happen, act. This might mean moving someone to a different role better suited to their capabilities. It might mean separation. But don't let performance issues drag on indefinitely. That's unfair to the individual, unfair to the team, and damaging to the organization.

This is hard. But it's necessary. Not everyone is suited to every role. Sometimes the kindest thing is helping someone understand that and move to where they can be successful.

Retention: Keeping Your Best People

Recruiting and developing people takes enormous investment. Losing them wastes that investment and creates disruption. Retention matters.

Key drivers of retention:

Development opportunities. People stay where they're growing. If they stop learning, they leave.

Meaningful work. Connection to purpose and mission creates retention. People want work that matters.

Relationship with manager. The saying "People don't leave organizations, they leave managers" is mostly true. The quality of someone's relationship with their direct supervisor is one of the strongest predictors of retention.

Culture and environment. Do people feel valued? Do they enjoy coming to work? Is there psychological safety?

Work-life balance. Government can't always compete on salary, but it often offers better work-life balance than private sector. Don't squander this by creating burnout through constant overtime and crisis.

Recognition and appreciation. People want to feel their contributions are noticed and valued. Regular, specific recognition matters.

Fair compensation. While not always the primary driver, people need to feel fairly compensated. If they're significantly underpaid relative to market, they'll eventually leave no matter what else you offer.

Pay attention to retention signals:

- Engagement scores declining
- Someone who was enthusiastic becoming withdrawn
- Frequent absences or seeming checked out
- Someone asking fewer questions or showing less initiative

- Resumes posted publicly or job searching activity

When you see these signals, have a conversation. "I've noticed you seem less engaged lately. Is everything okay? Is there something going on I should know about?" Sometimes you can address issues before someone decides to leave.

The Ultimate Goal: Self-Sustaining Capability Development

Your ultimate goal is creating an organization where capability development is self-sustaining. Where managers at all levels see developing their people as core responsibility. Where people take ownership of their own development. Where learning and growth are part of the culture, not programs you run from the top.

This doesn't happen overnight. But it happens when you:

- Model it consistently
- Build it into performance expectations and evaluations
- Provide resources and support
- Recognize and celebrate it
- Make it part of how your organization operates

When you have this, you've created organizational resilience. Your capability to handle future challenges grows continuously. You're not dependent on any individual. You have bench strength. You can pursue opportunities because you're building the capability to execute them.

That's the difference between high-performing IT organizations and mediocre ones. Not necessarily the capabilities they have today, but their capacity to continuously build the capabilities they need for tomorrow.

The Takeaway

Your organization is your people. Their capability is your organization's capability. If you're not intentionally developing that capability, you're slowly becoming less able to serve your organization and mission.

It requires ongoing investment:

- Time recruiting the right people
- Resources for training and development
- Manager attention to coaching and feedback
- Systems for performance management and career development
- Culture that values learning and growth

It's not quick. It's not cheap. But it's essential. Because as technology complexity grows and challenges grow with it, standing still means falling behind.

Invest in your people. Build their capabilities. Create paths for growth. Manage performance consistently. And your organization will develop the capacity to handle whatever comes next.

That's not just good for your people. It's good for your organization, your customers, and your own success as a leader.

How This Connects to the Broader Framework

People are the constraint and the multiplier. Every framework, process, and strategy in this book depends on capable people to execute it:

The leadership competencies you developed in Module 1 drive this work:

- Time prioritization (Section 1.2) protects the hours you need for coaching and development
- Self-awareness (Section 1.3) helps you understand your own development needs and model continuous learning
- Communication (Section 1.5) drives the coaching conversations and feedback that develop people

Building a healthy organization (Module 2) means investing in your people:

- Your leadership team (Section 2.1) needs continuous development to lead well
- Vision (Section 2.2) should inform what capabilities you develop
- Structure (Section 2.3) creates career paths and reporting relationships through which development happens
- Culture (Section 2.5) is shaped by whether people feel supported in development
- Communications (Section 2.6) carries developmental feedback and learning

Strategic alignment (Module 3) only works when capability development keeps pace:

- Strategic planning (Section 3.2) should identify capability gaps and development needs
- Your workforce plan should align with your strategic direction
- Service excellence (Module 4) depends on having capable people

Module 5: Continuously Improving is impossible without a learning culture and growth orientation.

Capability development isn't a program. It's how you build organizational capacity for the future.

Key Takeaways

- Your organization's capability is your people's capability, invest accordingly
- Effective capability development includes recruiting, continuous development, performance management, and career paths
- Most learning happens through work (70%), relationships (20%), and formal training (10%)

- Clear career paths and succession planning retain high performers and build bench strength
- Performance management should be developmental, not just evaluative
- Learning culture requires psychological safety, time for development, and leadership modeling
- Capability debt accumulates when you defer development, it becomes a crisis eventually
- Address performance issues directly with clarity, support, timeline, and follow-through
- Retention depends on development opportunities, meaningful work, relationships, and culture more than compensation alone

Reflection Questions

Assess your capability development practices:

1. What percentage of your budget and time is invested in developing people's capabilities?
2. Do people in your organization have clear career paths and understand how to progress?
3. How many of your current staff are being actively developed for future leadership roles?
4. When was the last time you had a developmental conversation (not status update) with each direct report?
5. If your top three performers left tomorrow, do you have people ready to step into those roles?
6. Do people feel their development is supported, or is it entirely their own responsibility?
7. What's your plan to address capability gaps between current skills and future needs?

The working documents for this section are in Appendix A.2.4.

Section 2.5

Culture and Environment

I'll never forget walking into a particular IT department during a site visit. The energy was wrong immediately. People sat at their desks with headphones on, isolated. When someone asked a question, others responded with obvious irritation. In meetings, people were defensive and guarded. Nobody laughed. Nobody seemed to enjoy being there.

The technical work was fine. Systems ran well. Projects got delivered. But the culture was toxic. And you could feel it the moment you walked in the door.

I asked the CIO about it. He seemed puzzled. "What do you mean? People do their jobs. We deliver results. What's the problem?"

The problem was that talented people were leaving. Sick time usage was high. Conflicts were constant. Innovation was non-existent because nobody wanted to stick their neck out. And people described IT as "technically competent but difficult to work with."

Six months later, that CIO was replaced. The new CIO's first priority wasn't technology or projects. It was culture. Within eighteen months, the transformation was remarkable. Same people, mostly. Same work. But completely different energy. People collaborated. They smiled. They challenged each other constructively. They innovated. They seemed to enjoy working there.

Business relationships improved, retention improved, and performance improved, because of culture changes, not technology changes.

Culture isn't a soft, optional thing. Culture is the environment people work in every day. And that environment determines whether people bring their full energy and creativity, or just show up and do the minimum required.

You can have great strategy, clear structure, talented people, and still fail if your culture is toxic or dysfunctional. Conversely, a healthy culture can overcome almost any other challenge because people are engaged, collaborative, and committed.

Culture matters. More than most CIOs realize.

What Culture Is

Culture is often described vaguely, "the way we do things around here." That's true but not actionable. Let me be more specific.

Culture is the collection of shared assumptions, beliefs, values, and behaviors that shape how people experience working in your organization.

It's visible in:

- How people treat each other in daily interactions
- What behaviors get rewarded and what behaviors get addressed
- How decisions are made and who's involved
- How mistakes are handled
- Whether people feel safe raising concerns or challenging ideas
- How conflicts are resolved
- Whether people collaborate naturally or protect territory
- How new people are integrated
- What people say about the organization when leadership isn't around

Culture is created by two things: **stated values** (what leadership says matters) and **lived values** (what gets rewarded, modeled, and reinforced). The gap between stated and lived values is where culture problems emerge.

If you say you value collaboration but reward individual heroics, collaboration isn't your real value. If you say you value transparency but punish people who raise problems, transparency isn't real. If you say you value work-life balance but constantly pressure people to work overtime, your stated value is meaningless.

Your actual culture is revealed by:

- What you pay attention to
- What you celebrate and recognize
- What you tolerate versus what you address
- How you respond to failure
- How you treat people under pressure
- What behaviors you model yourself
- Who gets promoted and who gets marginalized

Culture isn't what you say. Culture is what you do, consistently, over time.

The evidence on culture's impact is striking. Research consistently finds that organizational culture is among the strongest predictors of employee engagement, with similarly strong effects on retention, innovation, and customer satisfaction. For

government organizations specifically, culture quality was the strongest predictor of sustained performance improvement.

The Elements of Healthy Culture

Healthy cultures share common characteristics. Not all cultures look identical, different organizations have different personalities. But healthy cultures consistently show these elements:

1. Psychological Safety

People feel safe taking interpersonal risks. They can admit mistakes without fear of punishment. They can ask questions without feeling stupid. They can challenge ideas without being shot down. They can raise concerns without retaliation.

This is essential. Without psychological safety, everything else breaks down. People hide problems until they become crises. They don't share ideas for improvement. They don't challenge bad decisions. They become risk-averse and defensive.

Google's Project Aristotle, a multi-year study of team effectiveness, found that psychological safety was the single most important factor determining team performance, more important than individual talent, resources, or structure.

How to build psychological safety:

- **Model vulnerability.** Admit your own mistakes publicly. Say "I don't know" when you don't. Ask for help when you need it. This signals that vulnerability is acceptable.
- **Respond to concerns constructively.** When someone raises a problem, thank them for surfacing it. Don't shoot the messenger. Even if you can't fix the problem immediately, appreciate that they brought it forward.
- **Address blame and defensiveness.** When people respond to problems by pointing fingers or getting defensive, intervene. "Let's focus on understanding what happened and how to prevent it, not on who to blame."
- **Separate learning from evaluation.** When reviewing what went wrong, make it clear whether this is a learning conversation (no consequences) or an evaluation conversation (potential consequences). Don't conflate them.
- **Reward people who surface problems early.** When someone identifies an issue before it becomes a crisis, recognize that. Make it clear that early problem identification is valued, not penalized.

2. Trust and Respect

People treat each other with basic respect. They assume positive intent. They honor commitments. They follow through on what they say they'll do. They're honest in their communications.

Trust is the basis of effective teams. Without it, everything takes longer because people are verifying, double-checking, and protecting themselves. With it, work flows smoothly because people can rely on each other.

How to build trust:

- **Keep commitments.** Do what you say you'll do, when you say you'll do it. If circumstances change, communicate early. Reliability builds trust.
- **Be transparent in decision-making.** Explain why decisions are made. Share information openly. Don't keep people in the dark or surprise them unnecessarily.
- **Show competence.** Trust requires both character (you can be relied upon) and competence (you know what you're doing). Build both.
- **Show real care for people.** Take interest in people as humans, not just workers. Remember what matters to them. Check in on them during difficult times. Small gestures of care build enormous trust.
- **Address trust violations directly.** When someone breaks trust, through dishonesty, unreliability, or disrespect, address it immediately. Trust is fragile and must be protected.

3. Collaboration and Teamwork

People work together naturally. They share information. They help each other. They coordinate without being told to. They're generous with their knowledge and expertise. They see themselves as part of a team, not just individual contributors.

Collaboration doesn't happen automatically. It happens when the culture rewards it and when barriers to collaboration are removed.

How to build collaboration:

- **Create shared goals.** When people have collective accountability for outcomes, collaboration becomes natural. If everyone's only measured on individual performance, they'll optimize individually.
- **Remove structural barriers.** Physical separation, conflicting priorities, and unclear roles all inhibit collaboration. Address these structural issues.
- **Recognize collaborative behavior.** When someone goes out of their way to help a colleague, acknowledge it. When teams collaborate well, celebrate it. What gets recognized gets repeated.
- **Address territorialism.** When someone hoards information, protects their turf, or refuses to help colleagues, address it directly. Make clear this behavior doesn't align with your values.
- **Model collaboration yourself.** Ask for input. Share credit. Involve people in decisions. Admit when others have better ideas. Your behavior sets the standard.

4. Continuous Learning and Improvement

People are always asking "How can we do this better?" They learn from mistakes and successes. They experiment with new approaches. They stay current with the field. They're curious and adaptive.

A learning culture is essential in IT because technology changes constantly. What worked five years ago doesn't work today. Organizations that stop learning become obsolete.

How to build learning culture:

- **Normalize not knowing.** Create space for people to say "I don't know, but I'll find out" without judgment. In many technical cultures, there's pressure to be the expert. This inhibits learning.
- **Conduct post-mortems on both successes and failures.** Ask "What did we learn?" regularly. Make retrospectives routine, not something you only do when things go wrong.
- **Provide time and resources for learning.** Don't expect people to stay current entirely on their own time. Build learning into work expectations.
- **Share knowledge broadly.** When someone learns something valuable, create opportunities for them to share it. Brown bags, documentation, team presentations, make knowledge sharing expected and valued.
- **Celebrate experiments and calculated risks.** When someone tries a new approach, recognize the initiative even if it doesn't work perfectly. If you only celebrate successes, people won't risk trying new things.

5. Entrepreneurial Mindset

People think and act like owners, not just employees. They see opportunities and take initiative to pursue them. They solve problems creatively within resource constraints. They're willing to take smart risks and experiment with new approaches. They understand that in local government IT, you rarely have unlimited resources, so you must be entrepreneurial: resourceful, creative, and willing to try unconventional solutions.

An entrepreneurial culture doesn't mean everyone acts independently or ignores policies. It means people take ownership of outcomes rather than just completing assigned tasks. When they see a problem, they solve it rather than waiting for someone else to fix it. When they identify an opportunity to improve service or save money, they pursue it. When constraints limit traditional approaches, they find creative alternatives.

This is particularly critical in local government IT where:

- Budgets are constrained, requiring creative solutions rather than expensive purchases
- Small teams can't hire specialists for everything, so people must be versatile

- Departments have diverse needs that may not fit standard IT offerings
- Political and organizational dynamics require adaptive problem-solving
- Vendor relationships must be managed strategically, not just transactionally

How to build entrepreneurial mindset:

- **Give people ownership, not just assignments.** Instead of "Complete these tickets," try "You own help desk quality, here's current performance, what approaches will you try to improve it?" Ownership creates entrepreneurial thinking.
- **Reward initiative and problem-solving.** When someone identifies and solves a problem without being told, recognize it publicly. When people experiment with better approaches, celebrate the initiative even if the experiment doesn't work perfectly.
- **Create space for experimentation.** The 20% time for improvement work enables entrepreneurial behavior. People need permission and time to try new approaches.
- **Share constraints openly.** Don't hide budget limitations or resource constraints. When people understand the constraints, they can think entrepreneurially about working within them. "We can't afford a commercial solution, but we have these resources, what could we build or adapt?"
- **Model entrepreneurial thinking yourself.** When facing constraints or problems, model creative problem-solving. Let people see how you think through: "We can't do X the traditional way, so what if we tried Y instead?"
- **Reduce bureaucratic barriers.** If every small decision requires three approvals, people stop taking initiative. Trust people to make decisions and try things within appropriate boundaries.
- **Connect work to mission impact.** Help people see how their entrepreneurial solutions directly serve residents and the organization's mission. Purpose fuels entrepreneurial energy.

The entrepreneurial mindset is how small IT teams compete with much larger organizations, delivering exceptional results without exceptional resources, transforming "we can't because we don't have…" into "we could if we tried this creative approach…"

Organizations with strong entrepreneurial cultures don't just execute assigned work, they actively find ways to create more value, serve better, and continuously improve using whatever resources they have. This is what high-performing government IT requires.

6. Accountability and High Standards

People are accountable to each other and to commitments. Standards are clear. Good performance is expected and recognized. Poor performance is addressed.

People hold each other accountable, not just waiting for managers to enforce standards.

Accountability isn't punishment. It's clarity about expectations combined with follow-through. It's essential for high-performing cultures.

How to build accountability:

- **Set clear expectations.** People can't be accountable to unclear expectations. Be specific about what success looks like, what commitments mean, and what standards apply.
- **Follow through on commitments.** If you or your team commits to something, deliver. If you can't deliver, communicate early. Model the accountability you expect.
- **Address performance gaps directly.** When someone isn't meeting expectations, have the conversation. Provide clarity, support, and timeline for improvement. But don't ignore it.
- **Recognize excellence.** When people deliver exceptional work, acknowledge it publicly. Make it clear what excellent performance looks like.
- **Enable peer accountability.** Create structures where team members are accountable to each other, not just to managers. Shared goals, team metrics, and collective commitments create healthy peer accountability.

7. Recognition and Appreciation

People feel their contributions are noticed and valued. Good work is recognized regularly, not just during annual reviews. People express appreciation for each other. Success is celebrated.

Recognition is a basic human need. People want to know their work matters and is appreciated. Cultures that provide frequent recognition have higher engagement and retention than cultures where people feel unnoticed.

How to build recognition culture:

- **Make recognition specific and frequent.** Don't just say "Good job." Say "I really appreciated how you handled that difficult customer conversation yesterday. Your patience and clarity helped de-escalate what could have been a major conflict." Specific recognition is meaningful. Frequent recognition shows consistent attention.
- **Recognize both results and behaviors.** Celebrate successful project delivery. Also recognize someone who mentored a colleague, or handled a failure with grace, or went out of their way to help. Results matter, but so do the behaviors that build healthy culture.
- **Use multiple recognition channels.** Public recognition in team meetings. Private recognition in one-on-ones. Written recognition through emails or

awards. Peer recognition programs. Variety helps different people receive recognition in ways that resonate with them.

- **Encourage peer-to-peer recognition.** Don't make recognition only top-down. Create mechanisms for people to recognize each other. Connection grows. Appreciation spreads throughout the organization.
- **Celebrate team successes.** When the team accomplishes something significant, celebrate together. Pizza lunch, team outing, or just taking time in a meeting to reflect on the win. Shared celebration builds cohesion.

Employees who feel adequately recognized are substantially more engaged, more likely to stay with the organization, and more likely to recommend it as a great place to work.

The CIO's Role in Culture

Culture is shaped from the top. Your behavior as CIO has outsized impact on what culture emerges.

You shape culture through:

What you pay attention to. The things you ask about, the metrics you track, the issues you elevate, these signal what matters. If you only ask about project timelines and never ask about team morale, people learn that delivery matters but people don't. If you regularly ask "Are people growing? Are they challenged? Do they feel supported?" that signals different priorities.

What you model. Your behavior sets the standard. If you want collaboration, collaborate. If you want transparency, be transparent. If you want people to admit mistakes, admit your own. If you want work-life balance, model it by setting boundaries on your own time. Don't ask people to behave in ways you don't model yourself.

What you recognize and celebrate. Who gets promoted? Who receives awards? Who gets held up as examples? These choices communicate what excellence looks like in your organization. If individual superstars get all the recognition, collaboration won't thrive. If only technical excellence gets recognized, interpersonal skills won't be valued.

What you tolerate versus what you address. Culture is defined not just by what you say matters, but by what violations you tolerate. If someone is technically brilliant but treats people poorly, do you address the behavior or ignore it because they deliver results? If someone consistently misses commitments, do you hold them accountable or make excuses? What you tolerate becomes the actual standard, regardless of what you say you value.

How you handle pressure and adversity. Your behavior under stress reveals your true priorities. When there's a crisis, do you become controlling and blaming? Or do you stay calm, focus on problem-solving, and support your team? When

projects run into trouble, do you look for scapegoats or focus on learning? People watch how you handle hard times. That's when culture is really tested.

The stories you tell. The stories you share about past experiences, about people in the organization, about what happened in various situations, these stories convey culture. Do you tell stories of collaboration and learning? Or stories of heroics and individual achievement? Do your stories emphasize accountability or excuse-making? Stories are how culture gets transmitted.

You can't delegate culture. You can't outsource it to HR or a consultant. Culture follows leadership. And as CIO, you're the primary shaper of IT culture.

Assessing Your Current Culture

Before you can improve culture, you need to understand what your current culture is, not what you hope it is or what you say it is, but what people experience.

Ways to assess culture:

Anonymous surveys. Employee engagement surveys, pulse surveys, culture assessments. These give you quantitative data about how people experience the organization. Look especially at questions about:

- Psychological safety (do people feel safe speaking up?)
- Trust in leadership
- Collaboration and teamwork
- Recognition and appreciation
- Learning and development opportunities
- Work-life balance
- Overall satisfaction and engagement

Don't just collect survey data. Act on it. Share results transparently. Identify priority areas. Create action plans. Follow up.

Focus groups or listening sessions. Gather small groups and ask open-ended questions about their experience. "What's working well in our culture? What needs to improve? What makes this a great place to work? What makes it challenging?" The qualitative insights complement survey data.

Exit interviews. When people leave, find out why. Not just surface reasons ("I got a better offer") but real reasons ("I stopped growing and didn't see opportunities"). Exit interview data reveals culture problems you might not see otherwise.

Observation. Pay attention to how people interact. How do meetings feel? Do people speak up or stay silent? Do they challenge ideas or defer to authority? Do they help each other or stay in silos? Observation reveals culture in ways surveys can't capture.

360-degree feedback. How do people experience working with each other? 360 feedback reveals interpersonal dynamics that affect culture.

Turnover patterns. Who's leaving? High performers or low performers? People in certain roles or teams? After certain lengths of tenure? Turnover patterns reveal culture issues.

Be willing to hear uncomfortable truths. Your culture probably isn't as healthy as you think it is. Leaders tend to experience culture more positively than front-line staff because people are more guarded with leaders. The anonymous data and candid conversations reveal reality.

Changing Culture: The Hard Work

Culture change is slow and requires ongoing effort, but it is possible.

Steps to improve culture:

1. Acknowledge current reality honestly. Don't pretend problems don't exist. "Our engagement scores show that people don't feel psychological safety. That's not okay, and we're going to address it." Naming the problem is the first step.

2. Be clear about desired culture. What do you want the culture to be? What values and behaviors do you want to see? Be specific. "We're building a culture where people collaborate naturally, where it's safe to admit mistakes, where everyone is continuously learning." Paint a picture of what you're working toward.

3. Identify specific behaviors to encourage or change. Culture changes through behavior change. What behaviors do you want to see more of? What behaviors need to stop? Be concrete. "We want to see more cross-functional collaboration, more people admitting when they don't know something, more peer-to-peer recognition."

4. Model the behaviors yourself. You go first. If you want transparency, be radically transparent. If you want vulnerability, be vulnerable. If you want people to challenge ideas, welcome challenges to your own ideas. Your consistent modeling gives others permission to follow.

5. Address violations visibly. When someone behaves in ways that contradict your desired culture, address it. If you tolerate behavior that undermines the culture you want, the behavior wins and the culture doesn't change. This is hard but essential.

6. Recognize and celebrate examples of desired culture. When you see people living the culture you want, call it out. Make heroes of people who embody your values. Tell stories about these examples. What gets celebrated gets repeated.

7. Align systems and processes. Make sure your hiring, onboarding, performance management, and promotion decisions all support your desired culture. If your systems reward different behaviors than your stated values, the systems will win.

8. Be patient and persistent. Culture changes slowly. You won't see transformation in weeks or even months. But consistent attention over 12–24 months can create significant change. What matters is persistence, keep strengthening the culture you want through your attention, recognition, and decisions.

9. Measure progress. Track engagement scores, turnover, survey responses over time. Are things improving? Celebrate progress. Adjust approach if metrics aren't moving.

Culture change is hard because it requires changing habits and assumptions that are deeply embedded. People will revert to old patterns under stress. You'll get frustrated by slow progress. But culture change is possible when leadership is committed and consistent.

Organizations that successfully transform culture share a common thread: ongoing leadership commitment over 18 months or more. This is consistent with broader workforce research showing that culture change requires sustained investment in learning, development, and leadership modeling.

Culture Killers to Avoid

Certain behaviors and patterns are toxic to culture. Avoid these:

Blame and finger-pointing. When things go wrong, focusing on who to blame rather than how to fix it creates fear and defensiveness. People hide problems. They don't take risks. The organization stops learning.

Lack of accountability. When poor performance or bad behavior is tolerated, high performers get frustrated and either lower their standards or leave. Lack of accountability destroys culture as surely as excessive blame does.

Favoritism or perception of unfairness. When some people get special treatment, when decisions seem arbitrary, when rewards don't align with contribution, these create cynicism and erode trust. Fairness and consistency matter enormously.

Communication breakdowns. When people don't have information they need, when decisions are made in secret, when leaders aren't accessible, communication failures create rumors, mistrust, and disengagement.

Chronic overwork and burnout. When people are consistently working excessive hours, when there's no work-life balance, when burnout is normalized, culture suffers. People become bitter, resentful, and disengaged. Quality declines. Good people leave.

Micromanagement and lack of trust. When people can't make decisions, when every action requires approval, when they're not trusted, they stop taking initiative. They do exactly what they're told, nothing more. Creativity and engagement disappear.

Tolerating toxic people. One toxic person can poison an entire team. When someone is consistently negative, disrespectful, or undermining, and leadership doesn't address it, the entire culture suffers. Don't sacrifice organizational health to accommodate difficult individuals, no matter how technically skilled they are.

Saying one thing and doing another. This is the fastest culture killer. When stated values don't align with actual behavior, cynicism spreads. Staff become cynical

about anything leadership says. The gap between stated and lived values destroys credibility and trust.

Avoid these culture killers vigilantly. They're easier to prevent than to fix once they've taken root.

The Relationship Between Culture and Performance

Some CIOs still think culture is soft and optional, something you focus on when you have time after the "real work" is done. This is completely backwards.

Culture determines whether you can do the real work.

Good culture enables:

- Faster problem-solving because people collaborate naturally
- Better decision-making because diverse perspectives are included
- Higher innovation because people feel safe experimenting
- Stronger execution because people are engaged and committed
- Better retention because people want to stay
- Easier recruitment because people want to join
- Higher customer satisfaction because your team works well together and delivers consistently

Bad culture creates:

- Slower problem-solving because people work in silos and protect information
- Worse decisions because people don't speak up or challenge flawed thinking
- No innovation because people stick to safe, known approaches
- Weak execution because people are disengaged and doing the minimum
- High turnover and constant recruitment challenges
- Customer frustration because internal dysfunction becomes visible externally

Culture isn't separate from performance. Culture drives performance. Organizations with healthy cultures consistently outperform organizations with dysfunctional cultures, even when the dysfunctional organizations have more talent or resources.

A comprehensive 2024 study tracking 200 organizations over five years found that culture quality predicted performance outcomes better than strategy quality, leadership capability, or resource levels. Organizations in the top quartile for culture health significantly outperformed bottom quartile organizations.

Creating Space for Culture Work

Culture work doesn't happen in addition to operational work. And it doesn't happen in isolated events like annual retreats. Culture work is embedded in how you operate every day.

Culture work includes:

- How you run meetings (inclusive? Safe for disagreement? Focused or rambling?)
- How you handle conflicts when they arise (directly? Constructively?)
- How you respond when someone makes a mistake (learning opportunity or punishment?)
- How you make decisions (transparent? Inclusive? Autocratic?)
- How you recognize contributions (regularly? Specifically? Only major wins or also daily efforts?)
- How you onboard new people (do they learn your values? Meet the team? Feel welcomed?)
- How you conduct one-on-ones (coaching? Developmental? Or just status updates?)

Every interaction is an opportunity to strengthen or undermine culture. Every decision sends a signal about what matters. You don't need separate "culture time." You need to be deliberate about culture in everything you do.

Your time prioritization directly determines whether any of this is possible. If you're so consumed with operational firefighting that you never have time for one-on-ones, for team meetings, for coaching conversations, for being present with your team, you can't build healthy culture. Culture requires your ongoing attention and presence.

The Culture Imperative

Culture is not a program. It's not something you delegate to HR or fix with a retreat. Culture is the daily lived experience of working in your organization. And you, as CIO, are the primary architect of that culture.

You shape culture through:

- What you pay attention to
- What you model
- What you recognize and celebrate
- What you tolerate versus address
- How you handle pressure
- The stories you tell
- The systems you create

Your culture determines whether talented people want to work for you, whether they bring their full creativity and engagement, whether they stay or leave, and ultimately whether your organization can deliver on its mission.

Invest in building healthy culture. Be deliberate about it. Be consistent in backing it up. Address toxicity quickly. Celebrate examples of the culture you want. And be patient, culture changes slowly but powerfully.

A healthy culture is more than nice to have. It's what sustains high performance. Organizations with healthy cultures consistently outperform organizations with superior resources but toxic cultures.

Build the culture. The rest follows.

How This Connects to the Broader Framework

Culture determines whether your strategies and structures take hold or get rejected. A healthy culture makes good strategy stick. A toxic culture kills it:

Your personal leadership (Module 1) sets the cultural tone:

- Your purpose clarity (Section 1.1) tells you what kind of culture you're trying to build
- Self-awareness (Section 1.3) helps you recognize your impact on culture
- Political navigation (Section 1.4) is what keeps culture change from getting derailed
- Communication (Section 1.5) carries culture: what you say, how you say it, and what you don't say all shape norms

Nothing in Module 2 works without the right culture:

- Your leadership team (Section 2.1) creates and cascades culture
- Vision and values (Section 2.2) define desired culture
- Structure (Section 2.3) enables or inhibits collaborative culture
- People development (Section 2.4) happens more naturally in healthy culture
- Communications (Section 2.6) both reflects and shapes culture

Module 3's strategic alignment falls apart without healthy culture behind it:

- Governance (Section 3.1) works better when culture supports collaboration
- Strategy execution (Section 3.2) depends on engaged, aligned culture

Modules 4 and 5: You can't deliver excellent service or sustain improvement in a culture where people don't trust each other

Culture isn't a line item on your leadership to-do list. It's the water your organization swims in. When culture is healthy, everything you build works better. When it's toxic, nothing works the way it should.

Key Takeaways

- Culture is the lived experience of working in your organization, revealed by what you reward and tolerate
- Healthy culture requires psychological safety, trust, collaboration, continuous learning, accountability, and recognition
- Culture is shaped primarily by leadership behavior, what you model, recognize, and tolerate

- Culture change is slow (18–30 months) but possible through consistent attention and behavior change
- Certain behaviors kill culture: blame, favoritism, communication breakdowns, chronic overwork, micromanagement, tolerating toxic people
- Culture drives performance more than strategy, talent, or resources
- Culture work happens in daily interactions, not isolated programs
- The gap between stated values and lived values creates cynicism and distrust

Reflection Questions

Assess your organizational culture:

1. If you surveyed your team anonymously about psychological safety, what percentage would say they feel safe admitting mistakes?
2. What behaviors do you recognize and reward in practice (not what you say you value)?
3. What toxic behaviors are you currently tolerating? Why?
4. How do you personally respond when someone makes a mistake or raises a problem?
5. If someone described your organization's culture to a potential hire, what would they say?
6. What's the gap between your stated values and your lived values?
7. When was the last time you had an explicit conversation about culture with your leadership team?

The working documents for this section are in Appendix A.2.5.

Section 2.6

Communications

I was reviewing feedback from an employee engagement survey when a pattern emerged that troubled me. Multiple people across different teams said the same thing: "I don't know what's going on in the organization. I hear about major decisions after they're made. I feel out of the loop."

This surprised me. We had leadership team meetings. We sent regular emails. We had all-staff meetings quarterly. I thought we were communicating.

But as I dug deeper, I realized we had communications activities. We didn't have a communications system. Information flowed inconsistently. Some people were in the know. Others weren't. There was no reliable way for information to reach everyone who needed it. And there was no effective mechanism for information to flow up from the front lines to leadership.

We were doing communication. But we weren't doing it systematically or well.

That realization led to rebuilding our entire communications approach. Not by adding more meetings or sending more emails. By being deliberate about what information needed to flow where, through what channels, at what frequency. By creating systems that kept communication flowing reliably rather than sporadically.

The transformation wasn't dramatic. But the impact was. People felt more informed. They understood decisions better. They felt more connected to the organization. Trust improved because transparency improved. And critically, information that leadership needed to know started reaching us earlier and more reliably.

This section is about building communication systems that keep information flowing reliably throughout your organization.

Why Organizational Communications Matter

Individual communication skills are necessary but insufficient. Even if you're an excellent communicator personally, your organization needs structured communications systems to function well.

Why organizational communication systems matter:

Information needs to flow in multiple directions. Down from leadership to staff (direction, decisions, context). Up from staff to leadership (problems, ideas, ground truth). Across functions (coordination, collaboration). Without systems for this multi-directional flow, information gets stuck or lost.

Relying on informal communication doesn't scale. In a five-person team, informal communication might work. By fifteen people, it's breaking down. By thirty people, it's completely inadequate. You need formal communications structures.

Consistent communication builds trust. When people know they'll get information reliably, trust builds. When communication is sporadic or selective, people feel like information is being withheld or managed. Consistent systems create transparency.

Communication prevents problems. Many organizational problems start as small issues that could have been addressed early, if leadership had known about them. Communication systems that surface issues early prevent crises.

Communication creates coherence. When everyone has access to the same information about priorities, decisions, and context, coordination improves naturally. Misalignment often flows from information gaps.

Communication enables distributed decision-making. If information is hoarded at the top, all decisions have to flow through leadership. If information is broadly shared, people throughout the organization can make informed decisions autonomously.

The evidence on organizational communication is clear. A 2024 meta-analysis found that communication effectiveness was the single strongest predictor of employee engagement and organizational trust. For government organizations, communication quality was the strongest predictor of stakeholder satisfaction after service delivery quality itself.

The Communications Framework

Effective organizational communications require attention to four elements:

1. What information needs to be communicated

2. Who needs to receive it

3. Through what channels

4. At what frequency

Let's address each element systematically.

1. What Information Needs to Be Communicated

Not all information needs to be shared with everyone. But certain types of information should flow systematically:

Strategic information:

- Vision, mission, values, strategic priorities
- Progress toward strategic goals
- Major decisions affecting direction
- Organizational changes
- Budget and resource allocation decisions

Operational information:

- Project status and updates
- Service performance and metrics
- Process changes
- Policy updates
- System changes or outages
- Staffing changes

Contextual information:

- Why decisions were made
- What's happening in the broader organization
- Business feedback and concerns
- Industry trends or threats
- Lessons learned from successes and failures

Recognition and celebration:

- Individual and team achievements
- Project completions
- Service improvements
- Living organizational values
- Milestones and wins

Problem information (upward flow):

- Issues and obstacles
- Risks and concerns
- Ideas for improvement
- Ground truth about what's happening

Be deliberate: What information do people need to do their jobs effectively and feel connected to the organization? Don't assume they know. Don't assume informal channels will convey it. Build systems so it flows reliably.

2. Who Needs to Receive Information

Different audiences need different information at different levels of detail:

All staff: Need to know organizational direction, major decisions affecting everyone, recognition of achievements, and how their work connects to mission. They don't need detailed operational information about areas outside their responsibility, but they do need enough context to understand the organization broadly.

Leadership team: Needs strategic information, cross-functional operational information, early warning about problems, and detailed context for decision-making. They're responsible for leading the organization, so they need full information.

Functional teams: Need detailed information about their specific area, enough information about other areas to coordinate effectively, and clear understanding of how their work fits into the larger picture.

Individual contributors: Need clarity about their specific responsibilities and expectations, context for why their work matters, feedback on their performance, and opportunities to provide input and raise concerns.

Key stakeholders outside IT: Need information about IT services, changes affecting them, progress on initiatives they care about, and opportunities for input. They don't need internal IT operational details, but they do need transparency about what affects their work.

The mistake many organizations make is either over-communicating (flooding everyone with information they don't need) or under-communicating (keeping information unnecessarily restricted). Be thoughtful about who actually needs what information.

3. Through What Channels

Different types of information flow effectively through different channels. Build a communication architecture that uses appropriate channels for different purposes:

Face-to-face meetings (most effective for complex or sensitive information):

- **Leadership team meetings:** Weekly or bi-weekly. Focus on strategic issues, cross-functional coordination, decision-making. That's where your leadership team operates. Agenda should be strategic, not just status updates.
- **All-staff meetings:** Monthly or quarterly depending on size. Share organizational updates, recognize achievements, provide Q&A opportunities, build connection across the organization. These shouldn't be death by PowerPoint. Make them engaging and interactive.
- **Functional team meetings:** Weekly or bi-weekly within each functional area. Coordinate work, solve problems, share information, build team cohesion.

- **One-on-ones:** Weekly or bi-weekly between managers and direct reports. Developmental conversations, feedback, problem-solving, relationship-building.
- **Town halls or forums:** Occasional detailed discussions on specific topics, opportunities for extended Q&A, special announcements. Use these sparingly for important moments.

Written communications (good for documentation and reference):

- **Email updates:** Regular communications from CIO to all staff (weekly or bi-weekly). Brief updates on key happenings, decisions, recognition, upcoming events. Keep them short, scannable, and consistent.
- **Newsletters:** Monthly or quarterly deeper content. Articles about projects, profiles of team members, technical detailed explorations, lessons learned. Make them valuable, not just promotional.
- **Intranet or SharePoint:** Central repository for policies, procedures, organizational information, project documentation. This is your organizational memory. Keep it current and well-organized.
- **Dashboards and reports:** Regular reporting on key metrics, service performance, project status, budget. Visual, easy to understand, updated regularly.

Chat/messaging platforms (good for quick coordination):

- **Team channels:** For functional teams to coordinate daily work, ask quick questions, share updates.
- **Project channels:** For cross-functional project teams to collaborate.
- **All-staff channel:** For announcements, quick updates, organizational communication.
- **Use wisely:** Chat can become overwhelming if not managed. Set norms about what belongs in chat versus email or meetings.

Video communications:

- **For distributed teams:** Video conferencing enables face-to-face connection when physical presence isn't possible.
- **Recorded updates:** Occasional video messages from leadership can be more engaging than written updates. Keep them short (3–5 minutes).

Use the right channel for the right purpose. Complex decisions require meetings, not just email. Quick updates work fine in email. Documentation belongs on the intranet. Urgent issues might need multiple channels.

4. At What Frequency

Communication needs to be regular and predictable. People need to know when they'll get information. Sporadic communication creates uncertainty and rumors.

Recommended frequencies for different communication types:

Daily:

- Stand-ups or huddles for teams doing closely coordinated work
- Chat check-ins for urgent coordination

Weekly:

- Leadership team meetings
- Functional team meetings
- One-on-ones (or bi-weekly depending on your span)
- Email update from CIO to all staff (or bi-weekly)

Monthly:

- All-staff meetings (or quarterly for smaller organizations)
- Newsletter or deeper written communication
- Performance metric reviews

Quarterly:

- Strategic reviews and updates
- Board or executive updates
- Larger town halls or forums
- Employee engagement pulse surveys

Annually:

- Strategic planning
- Budget planning
- Full engagement surveys
- Performance evaluations

The specific frequencies matter less than consistency. If you commit to weekly updates, deliver them weekly. If you commit to monthly all-staff meetings, hold them monthly. Consistency builds trust. Sporadic communication erodes it.

The CIO Update: A Critical Communication Tool

One practice I strongly recommend: a regular (weekly or bi-weekly) update from the CIO to all staff. This becomes the backbone of organizational communication.

What to include in your update:

Brief highlights: What's happening right now? Major projects, initiatives, decisions. Keep it to 3–5 key items.

Context and why it matters: Don't just announce decisions. Explain the thinking behind them. Help people understand why.

Recognition: Call out individuals or teams who did excellent work or lived organizational values. Rotate through different people and types of contributions.

Looking ahead: What's coming up? What should people be aware of?

Connection to vision and purpose: Regularly remind people how current work connects to your vision. Make this connection explicit.

Open invitation for input: Encourage people to reach out with questions, concerns, or ideas. Make yourself accessible.

Keep it brief: 300–500 words maximum. People are busy. Respect their time by being concise.

Write in an authentic voice: Don't make it formal and corporate. Write like you're talking to people. Be human.

Be consistent: Send it the same day/time each week or every other week. Consistency matters more than perfect content.

This regular update creates a communication rhythm. People come to expect it and rely on it. It keeps you visible even when you can't physically be with everyone. It provides a reliable channel for you to share information and context.

All-Staff Meetings: Making Them Valuable

All-staff meetings are opportunities to build connection across the organization, share important information, and create dialogue. They're also easy to make boring and ineffective.

Making all-staff meetings effective:

Have a clear purpose: What are you trying to accomplish? Information sharing? Recognition? Building connection? Q&A? Be clear and structure the meeting accordingly.

Keep them engaging: Don't just present slides. Mix formats: short presentations, panel discussions, Q&A sessions, small group discussions, recognition moments.

Make them interactive: Create opportunities for people to ask questions, share ideas, discuss with each other. One-way presentations are deadly.

Recognize people: Celebrate achievements. Tell stories. Make people feel valued. Recognition should be a regular component.

Share important information: Use this time for major announcements, organizational updates, strategic direction. Things that affect everyone.

Connect to vision and purpose: Regularly repeat why the work matters and where you're headed. Make this connection alive, not just a slide people tune out.

Limit frequency but maximize impact: Monthly might be right for some organizations, quarterly for others. Don't meet so often they become routine and boring. But don't meet so infrequently that people forget you do them.

Get feedback: After meetings, ask a few people: "Was this valuable? What would make it better?" Continuously improve the format.

Follow up: If questions are raised that you can't answer immediately, follow up afterward with answers. Show that input is taken seriously.

One format that works:

- 10 minutes: CIO update on organizational priorities and major happenings
- 15 minutes: Deep dive on one important topic (project, initiative, challenge)
- 10 minutes: Recognition and celebrations
- 15 minutes: Open Q&A
- 10 minutes: Connection time (small group discussions or informal networking)

Total: 60 minutes, monthly or quarterly depending on organization size.

Upward Communication: Creating Channels for Information to Flow Up

Most communication systems focus on downward flow (leadership to staff). But upward flow (staff to leadership) is equally critical. Leaders need to know what's happening on the ground. Problems. Ideas. Concerns. Ground truth.

Creating effective upward communication:

Regular one-on-ones: These are your primary channel for understanding what individuals are experiencing. Use them to listen, not just to direct.

Skip-level meetings: Periodically meet with people who don't report directly to you. This gives you unfiltered information about what's happening deeper in the organization. Your direct reports might be filtering or spinning information (even unintentionally). Skip-levels help you get ground truth.

Anonymous feedback channels: Suggestion boxes (physical or digital), anonymous surveys, feedback forms. Some people won't speak up in person but will share concerns anonymously. Make these channels available and respond to input received.

Open door policy: Make it clear that anyone can come to you with concerns, ideas, or problems. Then be accessible when they do. If you're always too busy or dismissive when people bring issues, your open door policy is meaningless.

Regular pulse surveys: Short (5–10 questions) surveys asking how people are feeling about specific issues. These provide quantitative data on morale, satisfaction, specific concerns. Run them quarterly or when you need specific feedback.

Management by walking around: Get out of your office. Be present in work areas. Have informal conversations. Ask "How are things going? What's challenging right now? What ideas do you have?" Informal interaction often surfaces information that formal channels miss.

Retrospectives and post-mortems: After projects or incidents, conduct structured discussions about what went well and what could improve. These create safe forums for people to raise issues and ideas.

The critical element: When people provide upward feedback, respond to it. If you can't act on it, explain why. If you can act on it, do so and acknowledge that input led to change. If upward feedback disappears into a black hole, people stop providing it.

Upward communication quality is strongly linked to earlier problem identification, more innovation, and better leadership decisions. Yet most organizations systematically under-invest in upward communication channels.

Cross-Functional Communication: Breaking Down Silos

Information needs to flow not just up and down, but across functional boundaries. This is often the weakest link in organizational communication.

Enabling cross-functional communication:

Leadership team meetings: When your leadership team meets regularly and shares information openly, information flows across functions naturally. Each leader brings their area's perspective and carries information back.

Cross-functional project teams: When people from different functions work together on initiatives, they build relationships and communication channels that persist beyond the project.

Shared workspaces or communication channels: Create spaces (physical or digital) where people from different functions interact regularly. Shared Slack or Teams channels, common work areas, cross-functional lunch gatherings.

Job rotations or shadowing: When people spend time in other functional areas, they build understanding and relationships. They become bridges for communication.

Regular interdepartmental updates: Have functional leaders briefly share updates with the full leadership team or create written updates that circulate cross-functionally.

Shared goals and metrics: When functions have collective accountability for outcomes, they naturally communicate more to coordinate toward shared success.

The goal is creating natural touchpoints and relationships across boundaries. Silos persist because people lack relationships and channels across domains, not from territorial instinct. Build the relationships and channels, and information flows.

Communication During Change or Crisis

Normal communication rhythms work fine during steady state. But during change initiatives or crises, communication needs to intensify.

During organizational change:

Communicate more frequently: People need more information during uncertainty. Weekly updates might become daily. Monthly all-staff might become bi-weekly.

Over-communicate the why: People need to understand why change is happening, what problem it solves, what's staying the same, and what's changing. Repeat this context repeatedly.

Create opportunities for questions and concerns: Change creates anxiety. Provide forums where people can ask questions, voice concerns, and get answers. Don't just push information, create dialogue.

Be transparent about what you don't know: During change, you won't have all the answers. Say so. "Here's what we know. Here's what we're still figuring out. Here's when we'll have more information." Honesty builds trust even when news is uncertain.

Share progress and milestones: As change progresses, share what's been accomplished and what's next. This shows that change is real and into action, not just talk.

During crisis:

Establish an incident communication protocol: Who needs to know what, when, and how? Don't figure this out during the crisis. Have a plan ready.

Communicate frequently: Even if there's no new information, communicate. "We're still working on this. Here's what we know. Here's what we're doing. Next update in one hour." Silence during crisis creates rumors and panic.

Be clear about roles and responsibilities: Who's handling what? Who's the single point of contact for information? Avoid confusion by being explicit.

Focus on facts and actions: What happened? What are we doing about it? What's the impact? Stick to facts. Avoid speculation.

Follow up afterward: After the crisis resolves, communicate about lessons learned and what you're doing to prevent recurrence. People gain confidence that you're learning and improving.

Crisis communication builds or destroys trust. Handle it well, and people trust you to lead through difficulty. Handle it poorly, and credibility erodes.

Communication Tools and Technology

Technology enables communication but doesn't replace thoughtful communication strategy. Don't assume that implementing Slack or Teams solves your communication challenges. Tools are enablers, not solutions.

Communication Norms and Expectations

Even with good systems and tools, you need clear norms about how communication works in your organization.

Establish norms around:

Response time expectations: How quickly should people respond to emails, chats, calls? What's urgent versus routine? Be explicit so people know what's expected.

Appropriate channels for different types of communication: What goes in email versus chat versus meetings? Reduce confusion by being clear about when to use which channel.

After-hours communication: Are people expected to respond to evening/weekend communication? Set boundaries. Don't create always-on culture unless absolutely necessary.

Meeting protocols: Start on time, end on time, have agendas, include right people, document decisions. Make meetings effective rather than time wasters.

Email etiquette: Use clear subject lines, bottom-line-up-front for important messages, appropriate use of cc/bcc, reply-all judiciously. Small etiquette norms make email more effective.

Respect for focus time: Create expectations that people can have uninterrupted time for deep work, not expected to be responsive 24/7 to messages.

Document these norms. Share them with new hires. Revisit them periodically. When norms are clear and consistent, communication becomes more effective with less friction.

Measuring Communication Effectiveness

How do you know if your communication systems are working? Measure outcomes:

Include communication questions in engagement surveys:

- "I receive the information I need to do my job effectively"
- "I understand organizational priorities and direction"
- "I feel informed about decisions that affect my work"
- "Leadership communicates transparently"
- "I have opportunities to provide input and feedback"

Track these scores over time. Improvement indicates your communication systems are working.

Monitor attendance and engagement in communication forums:

- Are people attending all-staff meetings?
- Are they asking questions in Q&A sessions?
- Are they opening and reading your email updates?
- Are they participating in feedback channels?

Low participation might indicate communication isn't resonating or providing value.

Pay attention to rumors and misinformation:

- When you hear about major decisions or changes you didn't communicate, that's a signal your communication isn't reaching everyone
- Rumors spread when official communication is absent or inadequate

Track response time to upward communication:

- When people raise issues, how long until they get response?

- When they provide feedback, do they see action or just silence?

Ask directly:

- In one-on-ones: "Do you feel well-informed about what's happening?"
- In team meetings: "What communication is working well? What's not?"
- In surveys: "How can we improve organizational communication?"

Use this feedback to continuously improve your communication systems. They're never perfect. Keep iterating.

What This Means

Communication is the circulatory system of your organization. When it works well, information flows where it needs to go, decisions are well-informed, people feel connected and aligned, and problems surface early. When it doesn't work, information gets stuck, people feel out of the loop, decisions are made with incomplete information, and problems fester until they become crises.

Building effective organizational communication requires:

- Clarity about what information needs to flow where
- Multiple channels for different types of communication
- Consistent rhythms and frequencies
- Upward and cross-functional flow, not just downward
- Appropriate tools used well
- Clear norms and expectations
- Continuous measurement and improvement

Communication systems aren't set-and-forget. They need ongoing attention and adjustment. But when they're working well, they change everything about how your organization operates.

Your individual communication skills matter. But without organizational communication systems, even excellent individual communication can't create the information flow your organization needs.

Build the systems. Maintain them consistently. And watch how much easier the work becomes when people have the information they need, when they need it, through channels that work.

How This Connects to the Broader Framework

Communication systems are the circulatory system of your organization. Vision, strategy, culture, accountability. None of it reaches people without reliable communication:

Everything here starts with your Module 1 leadership foundation:

- Your personal communication skills (Section 1.5) model what effective communication looks like

- Your time prioritization (Section 1.2) is what makes room for communication forums like one-on-ones and all-staff meetings
- Your political navigation (Section 1.4) helps you communicate with diverse audiences

Module 2's organizational health work can't function without strong communications:

- Your leadership team (Section 2.1) needs structured communication to function effectively
- Vision and purpose (Section 2.2) must be communicated constantly to stay alive
- Structure (Section 2.3) creates the formal channels through which communication flows
- People development (Section 2.4) happens largely through communication (coaching, feedback)
- Culture (Section 2.5) is shaped and sustained through communication

The strategic work in Module 3 can't function without reliable communication systems:

- Governance (Section 3.1) depends on effective communication among business leaders
- Strategic plans (Section 3.2) only become action when they're communicated clearly and consistently
- Everything in Module 3 depends on information flowing reliably

Modules 4 and 5: Delivering great service and getting better over time both depend on reliable information flow

Communications ties everything else together. Without reliable information flow, vision stays abstract, strategy stays on paper, and culture erodes.

Key Takeaways

- Communication systems carry reliable multi-directional information flow, beyond what individual communication skills can achieve
- Effective systems define what information flows to whom, through which channels, at what frequency
- Multiple channels serve different purposes: meetings for complex issues, email for documentation, chat for quick coordination
- Upward and cross-functional communication are often the weakest links and need deliberate attention
- Regular CIO updates and all-staff meetings create communication backbone
- Crisis and change require intensified communication

- Clear norms about channels and response expectations reduce friction
- Measurement through surveys and feedback confirms systems are working
- Consistency matters more than perfection, reliable communication builds trust

Reflection Questions

Assess your communication systems:

1. Can every person in your organization explain your top three priorities and why they matter?
2. What information do you wish flowed more reliably up to you from front-line staff?
3. How many days typically pass between a major decision and when everyone affected knows about it?
4. What percentage of organizational problems are you learning about only after they've become crises?
5. If you stopped sending updates for a month, who would notice? Who wouldn't?
6. What communication forums feel valuable versus obligatory time-wasters?
7. Where do silos exist where information doesn't flow across functional boundaries?

The working documents for this section are in Appendix A.2.6.

Module 2: Summary

Building a Healthy Organization: What Makes Everything Else Work

If I could give one piece of advice to every new government IT leader, it would be this: don't start with technology strategy. Start with your organization. I've watched technically brilliant CIOs fail because they inherited broken cultures and tried to build strategy on top of dysfunction. I've watched average technologists succeed spectacularly because they built healthy teams first and let that health carry the rest.

Module 2 is about building the organizational conditions that make the rest of this framework possible. Not theory. Not HR talk. The practical, daily work of creating an environment where talented people want to stay, do their best work, and pull in the same direction.

The six sections of this module covered the pillars of organizational health:

1. **Your Leadership Team** (Section 2.1). Building a cohesive team that operates with trust, shared purpose, and mutual accountability

2. **Vision and Purpose** (Section 2.2). Creating a direction that connects daily work to real impact

3. **Organizational Structure** (Section 2.3). Designing clear roles, authority, and coordination mechanisms

4. **Capabilities and People** (Section 2.4). Developing talent through recruiting, development, performance management, and career paths

5. **Culture and Environment** (Section 2.5). Shaping the daily lived experience through values, behaviors, and norms

6. **Communications** (Section 2.6). Building systems for reliable multi-directional information flow

These six pillars are interconnected. Culture reflects leadership behavior, structure enables or inhibits communication, vision guides capability development, and communications carries everything. You can't work on one in isolation. But you can address all of them with a deliberate, sustained approach.

Why Organizational Health Matters

Technical excellence without organizational health leads to frustrated teams, high turnover, and underperformance. Organizational health without technical excellence limits impact. But organizational health enables everything else.

When your organization is genuinely healthy:

- Talented people want to work for you and stay with you
- People bring full energy and creativity to their work
- Collaboration happens naturally across boundaries
- Problems surface early before becoming crises

- Change initiatives succeed because people are aligned and engaged
- Business partners see IT as a strategic ally
- Your organization can execute strategy

Don't mistake this for soft work. Organizational health drives sustained high performance.

How Module 2 Builds on Module 1

Module 1 developed your personal leadership competencies. Module 2 applied those competencies to building organizational health:

- Your **purpose clarity** (1.1) translated into organizational **vision** (2.2)
- Your **time management** (1.2) created space for **team development** (2.1) and **people development** (2.4)
- Your **self-awareness** (1.3) helped you recognize your impact on **culture** (2.5)
- Your **political navigation** (1.4) enabled you to build your **leadership team** (2.1) and design effective **structure** (2.3)
- Your **communication skills** (1.5) enabled you to build **communication systems** (2.6) and shape **culture** (2.5)

Without the Module 1 competencies in place, Module 2 work is much harder. With them, you can systematically build organizational health.

How Module 2 Prepares for Module 3

The organizational health you've built in Module 2 prepares you for strategic alignment (Module 3):

- Your **leadership team** (2.1) will operate your governance structure (3.1)
- Your **vision** (2.2) will guide your strategic planning (3.2)
- Your **structure** (2.3) will determine how work gets prioritized and executed
- Your **capable people** (2.4) will deliver on strategy
- Your **culture** (2.5) will determine whether strategic initiatives succeed
- Your **communications** (2.6) will carry strategic direction throughout the organization

Strategy execution depends on organizational health. Module 2 builds that health. What comes next in Module 3 is translating it into strategic alignment.

Integration Across Pillars

The five pillars of organizational health are interconnected. As you work on your priority area, pay attention to how it affects other areas:

Working on Leadership Team? This will improve communications and culture.

Working on Vision? This will guide structure decisions and capability development.

Working on Structure? This will affect how your leadership team operates and how communications flow.

Working on Capabilities? This supports vision execution and improves culture.

Working on Culture? This affects everything, team dynamics, communication effectiveness, capability development.

Working on Communications? This supports all other pillars and makes each of them more effective.

Don't try to perfect everything simultaneously. But do pay attention to the connections as you work on your priority area.

Common Pitfalls to Avoid

Watch for these common mistakes as you put organizational health improvements in place:

Treating organizational health as a program with an end date. This is ongoing work, not a project. Culture, communications, and capabilities require continuous attention.

Working on structure or systems without addressing culture. New structures don't fix culture problems. Start with culture and leadership behavior.

Creating vision statements without living them. Vision only matters if it guides decisions and is communicated constantly.

Investing in capability development without creating career paths. People need to see where development leads or they'll develop elsewhere.

Building communication systems without making sure the content is valuable. More communication isn't better if it's not useful. Focus on quality and relevance.

Focusing only on your direct reports without cascading to the full organization. Organizational health has to reach every level, not just leadership.

Expecting quick results. Culture change takes 18–30 months. Capability development is continuous. Be patient and persistent.

Next Steps

1. **Complete the Module 2 Self-Assessment in Appendix A.2.M** to establish your baseline across all five pillars

2. **Identify your top 1–2 priority areas** based on your assessment scores and organizational needs

3. **Create your 90-day action plan** using the template in Appendix A.2.M

4. **Share your plan with your leadership team** and get their input and commitment

5. **Schedule monthly check-ins** to review progress and adjust approach

6. **Begin implementation immediately** - don't wait for perfect conditions

7. **When ready, proceed to Module 3: Working on the Right Stuff** to translate organizational health into strategic execution

The Long View

Building organizational health is not quick. It's not easy. It requires ongoing attention and consistent effort over months and years.

But it's the most important work you do as a leader. Because organizational health determines success factors:

- Whether talented people want to work for you
- Whether strategy gets executed or just documented
- Whether your organization can adapt to change
- Whether you're building something sustainable or constantly firefighting

The organizations that succeed aren't the ones with the best technology or the biggest budgets. They're the ones that are healthy at their core, where people are engaged, aligned, and continuously improving.

You have the roadmap, the frameworks, and the self-assessment. Now it's time to do the work.

Build the healthy organization.

Final Thoughts

You've now completed Module 2: Building a Healthy Organization. This module represents the foundation everything else is built on. Technical excellence, strategic planning, governance structures, none of these deliver value without organizational health.

Key Reminders:

1. **Organizational health is not a program.** It's not something you implement and finish. It's the ongoing work of building and maintaining the environment where people can do their best work.

2. **Start with your leadership team.** Everything cascades from there. If your leadership team isn't healthy, cohesive, and aligned, the rest of the organization won't be either.

3. **Culture is shaped by what you model, recognize, and tolerate.** Not by what you say. Your daily behavior determines culture more than any values statement.

4. **Communication is the connective tissue.** Without effective communication systems, all the other pillars struggle. Invest in building reliable, multi-directional information flow.

5. **People are your only sustainable competitive advantage.** Technology can be copied. Processes can be replicated. But a team of talented, engaged, continuously developing people, that's unique and powerful.

6. **Be patient but persistent.** Organizational health improvements take time, typically 12–24 months to see significant transformation. But consistent attention creates compound effects.

7. **Measure and adjust.** Use the Module 2 Self-Assessment in Appendix A.2.M quarterly. Track engagement scores. Pay attention to turnover and feedback. Adjust your approach based on what's working.

8. **Celebrate progress.** When you see improvements in team dynamics, culture, or capabilities, acknowledge them. Recognizing progress creates momentum.

You're Ready.

At this point, you understand the five pillars of organizational health and have frameworks, assessment tools, and templates to start building each one.

Now it's time to apply these frameworks to your organization. To build the healthy organization the rest of the framework depends on.

The work is hard. It requires ongoing attention and consistent effort. But it's the work that makes all other progress possible. Because organizational health determines whether your organization can execute strategy, deliver value, and sustain performance over time.

Build the health to make possibilities endless.

The working documents for this module are in Appendix A.2.M.

MODULE 3

WORKING ON THE RIGHT STUFF

Introduction to Module 3

Two years into the role, a CIO friend had IT running well by most measures. Systems were stable. The help desk was responsive. Projects were being delivered. Staff morale was good. The County Executive seemed satisfied with IT's performance.

But he couldn't shake a nagging feeling that they were working hard on the wrong things.

One of the County's top strategic priorities was economic development, attracting businesses and creating jobs. Yet when he looked at IT's project portfolio, most of their work had nothing to do with economic development. They were upgrading infrastructure, implementing new systems, and solving operational problems. All necessary work, but none of it directly advancing the county's listed important goal.

The Planning Department desperately needed a new permitting system that would cut processing times from six weeks to two weeks, a change that would directly support economic development by helping businesses open faster. But that project kept getting deferred because they were "too busy" with other things.

The disconnect was obvious once he saw it.

That realization led to a fundamental shift in how he approached IT leadership. He stopped asking "What does IT need to do?" and started asking "What does the organization need IT to do?" He stopped prioritizing based on technical necessity and started prioritizing based on strategic alignment.

The Problem Most IT Organizations Face

Talk to any CIO in local government and you'll hear the same frustrations:

"We never have time for strategic work because we're constantly firefighting."

"Every department thinks their project is the most important. We can't say no effectively."

"We keep starting initiatives we never finish because something urgent interrupts."

"Nobody understands what IT does. They just know we're slow or we say no a lot."

"Our budget is always under pressure, but we can't articulate the value we're delivering."

These aren't technical problems. They're strategic alignment problems.

Without governance, you can't prioritize work, so everything feels urgent and nothing strategic gets done. Without planning, you're reacting instead of leading, constantly responding to others' priorities instead of driving your own. Without clear service definitions, people have unrealistic expectations and you have no basis for managing them. Without financial discipline, you can't make strategic investments or show value.

Most IT organizations are stuck in this reactive mode. They deliver services. They complete projects. But they're not strategically in step with organizational priorities. And they know it. They feel it. They're frustrated by it.

But they don't know how to break out of the pattern.

This module provides the way out.

Why Strategic Alignment Matters

In Module 1, we focused on personal leadership competencies, the skills you need as an individual leader. In Module 2, we focused on organizational health, building the team, structure, and culture that enable IT to function well.

Module 3 builds on those foundations to address the critical question: How do you make sure IT works on the right things?

Without strategic alignment, IT becomes reactive. You work on whatever seems urgent, whatever department heads ask for loudest, whatever technical problems appear most pressing. You're busy and productive, but not necessarily effective. You

might be solving the wrong problems, building the wrong capabilities, or investing resources in the wrong places.

With strategic alignment, IT becomes a strategic partner. You work on things that advance organizational mission. You invest resources where they create most value. You make conscious, deliberate choices about priorities based on what matters most.

Strategic alignment transforms IT from cost center to mission enabler, from "the computer department" to strategic partner. You stop justifying your existence every budget cycle and start being recognized as vital to organizational success.

Strategic alignment is the strongest predictor of IT value delivery. Research consistently shows that IT organizations with high strategic alignment deliver significantly more business value and higher stakeholder satisfaction than those operating without clear alignment to organizational priorities. For government specifically, alignment quality, the degree to which IT investments and activities connect to organizational mission, is the single biggest factor in how stakeholders perceive IT effectiveness.

What Strategic Alignment Means

Strategic alignment means your IT organization is deliberately focused on work that advances organizational priorities, with clear governance so that the right work gets done, strategic planning guides multi-year direction, and frameworks that drive consistent decision-making.

Strategic alignment includes:

Governance and Alignment, Structured decision-making about priorities, investments, and resource allocation. Not bureaucracy. Clarity about how decisions get made and who's involved.

Strategic Planning, Multi-year roadmap for where IT is going and why. Not a document that sits on a shelf. A living plan that guides decisions and investment.

Frameworks and Standards, Consistent approaches to architecture, security, and technology decisions. Not rigid rules. Guardrails that enable good decisions without reinventing the wheel.

Services and Products, Clear definition of what services IT provides and customer involvement in product decisions. Not marketing language. True partnership with the business.

Budget and Economics, Financial discipline about how IT money is allocated and what value it delivers. Not just tracking spending. Strategic investment thinking.

When these elements work together, you build cohesion. Work gets prioritized based on actual organizational priorities. Resources flow to what matters most. People understand what to expect. Decisions are made consistently. And you can articulate the value IT delivers.

The Five Dimensions of Strategic Alignment

This module addresses five interconnected dimensions that create strategic alignment:

Section 3.1: IT Governance, Structured decision-making about priorities, investments, and resource allocation. This is the starting point. Without governance, you can't prioritize work or make strategic investments. (This builds on the political skills from Section 1.4 and the organizational structure from Section 2.3.)

Section 3.2: Strategic Planning, Multi-year planning that translates organizational strategy into IT direction. That roadmap connects today's work to tomorrow's goals. (This builds on purpose clarity from Section 1.1 and vision from Section 2.2.)

Section 3.3: Frameworks and Standards, Consistent approaches to security, service management, architecture, and technology decisions. These provide guardrails that enable good decisions without requiring leadership involvement in every choice.

Section 3.4: Services and Products, Clear definition of what IT provides and partnership with customers in selecting products and technologies. This makes sure IT serves actual organizational needs, not just IT preferences.

Section 3.5: Budget and IT Economics, Financial discipline and strategic investment thinking. That way, resources flow to priorities and enables you to show value delivered.

These five dimensions work together as an integrated system:

- Governance sets direction and makes decisions
- Strategic planning documents the roadmap
- Frameworks enable consistent execution
- Service alignment helps customer focus
- Budget allocates resources to priorities

When these elements align, IT works on the right stuff. When they don't, IT works hard but not necessarily on the right things.

Why IT Organizations Struggle with Strategic Alignment

If strategic alignment is so important, why do so many IT organizations struggle with it?

Because it requires saying no. Strategic alignment means declining work that doesn't advance priorities. It means telling department heads "not now" even when they're frustrated. Most IT leaders avoid this conflict. They say yes to everything and then wonder why nothing strategic gets done.

Because it requires ongoing attention. Strategy and governance aren't one-time activities. They require ongoing focus, meetings, planning sessions, decision forums. When you're drowning in operational work, this feels impossible.

Because it requires leadership courage. Strategic alignment surfaces difficult trade-offs. Budget constraints. Competing priorities. Tough decisions about what not to do. Many leaders avoid these conversations because they're uncomfortable.

Because people resist structure. Governance can feel like bureaucracy. Planning can feel like constraint. Some people want IT to just respond to their needs immediately without prioritization or process. Building coherence requires managing these expectations.

Because the benefits are medium-term. When you invest time in governance or planning, you don't see immediate results. The payoff comes months later when decisions are clearer and work is more focused. But leaders trapped in short-term thinking can't see past the immediate opportunity cost.

Because it exposes organizational dysfunction. When you create governance structures, you expose conflicting priorities and resource constraints. These problems were always there, governance just makes them visible. And many organizations would rather avoid that visibility than address the underlying issues.

These are real obstacles. But they're not insurmountable. Thousands of IT organizations have built effective strategic alignment despite these challenges. You can too.

What Strategic Alignment Looks Like

Without strategic alignment:

- IT priorities are driven by urgency and squeaky wheels
- Leaders outside IT don't understand what IT does or why it costs what it does
- Budget requests face skepticism because value isn't clear
- Projects are approved based on who asks loudest, not strategic importance
- IT has no clear multi-year direction, each year feels like starting over
- Services don't match what customers need
- Security and operational decisions are ad hoc, not systematic
- IT is seen as cost to be minimized rather than investment to be optimized

With strategic alignment:

- IT priorities clearly connect to organizational strategic goals
- Leaders across the organization understand IT's value and contributions to mission
- Budget is defended through proven strategic impact
- Projects are prioritized through governance based on strategic alignment
- IT has clear direction guided by multi-year strategic plan
- Services are designed with customer input and meet actual needs
- Security and operations follow proven frameworks and standards
- IT is seen as a strategic partner enabling organizational success

The difference is fundamental, not just for IT, but for the entire organization.

How Module 3 Builds on Modules 1 and 2

Strategic alignment requires the foundations from Modules 1 and 2:

From Module 1, you need:

- Purpose clarity (1.1) to connect IT work to organizational mission
- Time management (1.2) to create space for strategic work amid operational demands
- Self-awareness (1.3) to recognize when you're avoiding hard strategic decisions
- Political navigation (1.4) to manage stakeholder relationships and build consensus
- Communication (1.5) to translate between technical and business language

Without these personal competencies, strategic alignment work becomes overwhelming or ineffective.

From Module 2, you need:

- Strong leadership team (2.1) to execute strategic direction
- Clear vision (2.2) that aligns with organizational mission
- Effective structure (2.3) with clear roles and accountabilities
- Capable people (2.4) who can deliver strategic priorities
- Healthy culture (2.5) that embraces change and focuses on mission
- Good communications (2.6) to keep everyone informed and engaged

Without organizational health, you can create perfect strategic plans and governance structures, but execution fails.

Strategic alignment is where personal leadership (Module 1) and organizational capability (Module 2) translate into organizational impact. It's the bridge from being a good leader to leading IT that makes strategic difference.

What You'll Learn in Module 3

This module provides practical frameworks and guidance for each dimension of strategic alignment:

Section 3.1: IT Governance shows you how to create decision-making structures that work. You'll learn governance models appropriate for different organization sizes, how to engage business partners effectively, and how to make governance valuable rather than bureaucratic.

Section 3.2: Strategic Planning walks you through building an IT strategic plan that guides decisions. You'll learn how to connect to organizational strategy, engage stakeholders in planning, and create roadmaps that balance multiple competing demands.

Section 3.3: Frameworks and Standards covers the essential frameworks every IT organization needs, NIST Cybersecurity Framework, ITSM processes, technology standards, data governance, and architecture principles. You'll learn how to implement frameworks that add value without creating bureaucracy.

Section 3.4: Services and Products addresses the critical mindset shift from IT as provider to IT as partner. You'll learn how to create service catalogs, engage customers in Services and Products decisions, and manage technology lifecycles transparently.

Section 3.5: Budget and IT Economics provides strategies for building defensible budgets that show value. You'll learn how to justify IT investments in business terms, manage budgets strategically, create cost transparency, and demonstrate value systematically.

Each section provides real examples, practical tools, and reflection questions. Self-assessments and working documents are consolidated in Appendix A: The Field Guide.

Getting Started with Strategic Alignment

If strategic alignment feels overwhelming, start here:

First, assess current state. Where are you strong? Where are significant gaps? The self-assessments in Appendix A: The Field Guide help with this.

Second, prioritize. You can't fix everything at once. Pick 1–2 areas where improvement would create most value. For many organizations, starting with basic governance structure creates the scaffolding for further improvement.

Third, start simple. Don't try to implement perfect practices immediately. Start with minimum viable versions that add value, then evolve them over time.

Fourth, show value. When strategic alignment practices deliver value, governance enables a good decision, strategic planning guides successful prioritization, frameworks prevent an outage, make that value visible. Success breeds support.

Fifth, be patient but persistent. Strategic alignment takes time. Cultural change is slow. But consistent effort compounds. Small improvements create momentum for larger changes.

The Promise of Strategic Alignment

When you invest in strategic alignment, several things change:

Organizational relationships improve. When leaders see that IT understands and serves organizational priorities, trust builds. IT becomes partner, not vendor.

Budget conversations change. Instead of defending line items, you're discussing strategic priorities and trade-offs. Budget requests are supported rather than challenged.

Team engagement increases. When staff understand how their work connects to organizational mission, work has meaning beyond technical tasks.

Decision-making improves. Governance structures create clear processes for making tough choices. Strategic plans provide criteria for prioritization.

IT credibility strengthens. When you consistently deliver what you promise and show value, credibility compounds over time.

Your job becomes more fulfilling. Being a strategic partner is more rewarding than being a reactive support function. Strategic alignment makes IT leadership satisfying rather than frustrating.

These changes don't happen overnight. But they happen. I've seen it in my own experience and in dozens of IT leaders I've worked with. Strategic alignment moves IT from perpetual underdog to recognized contributor.

That transformation is what Module 3 enables.

In Summary

Strategic alignment answers the fundamental question: Is IT working on the right stuff?

Without it, IT is reactive, disconnected, and undervalued, no matter how technically excellent the work.

With it, IT is strategic, mission-focused, and recognized as essential partner, because the work demonstrably matters.

The five sections of this module provide the frameworks, practices, and guidance for building strategic alignment systematically. You don't need to implement everything perfectly. You need to make consistent progress in the right direction.

Let's get started.

Section 3.1

IT Governance

At a statewide conference, a CIO told me a story I will never forget. He was six months into a major ERP implementation when the County Executive asked him a simple question: "Why are we spending money on this when the Sheriff just told me his records system is about to fail and we're not funding the replacement?"

He didn't have a good answer. Because there wasn't one. Both projects were important. Both had strong advocates. Both had legitimate business cases. But they never systematically prioritized them against each other. He started the ERP because that's what he had planned to do, and hadn't funded the Sheriff's system because… well, because it hadn't been part of the plan yet.

The County Executive was frustrated. The Sheriff was frustrated. The CIO was embarrassed. Because the question exposed something fundamental: he didn't have a real governance process. He had project approval processes. He had budget processes. But he didn't have a systematic way to prioritize competing demands, make strategic investment decisions, and verify resources flowed to what mattered most.

That meeting led to building a new IT governance structure. Not overnight. Not perfectly. But systematically, over about eighteen months. And it transformed how IT worked in his organization.

Suddenly, they had a forum where department heads could see all the competing demands. They had a process for evaluating and prioritizing them. They had transparency about why decisions were made. They had accountability for following through on priorities. And they had a mechanism for saying "not now" to good ideas that weren't top priorities, without those decisions being arbitrary or political.

Governance didn't solve all his problems. But it gave his organization a way to make hard decisions systematically, with stakeholder input, based on clear criteria. And that changed everything.

What IT Governance Is

Let me start by clarifying what governance is and isn't.

Governance is NOT:

- Bureaucracy for its own sake
- A way to slow things down or say no to everything
- A committee structure where nothing gets decided
- Something only large organizations need
- An excuse to avoid accountability

Governance IS:

- Structured decision-making about IT priorities, investments, and resources
- A way to get the right people involved in important decisions
- Transparency about how decisions are made and why
- Accountability for decisions and their outcomes
- A mechanism for balancing competing demands strategically

A system where authority matches accountability, those who make decisions own the outcomes, and those accountable for outcomes have authority to decide

Governance answers three questions:

1. What decisions need to be made? (Investment priorities, resource allocation, standards, strategic direction)

2. Who should be involved in making them? (Which stakeholders have legitimate input? Who has authority to decide?)

3. How will decisions be made? (What process? What criteria? What information is needed?)

When these questions are answered clearly and the system is followed consistently, you have governance. When they're ambiguous or ignored, you have chaos.

The evidence on IT governance is compelling. MIT CISR research found that top-performing enterprises generate significantly greater returns on their IT investments, and that firms with superior governance substantially outperform firms with poor governance given the same strategic objectives.

Why Governance Matters (Especially in Local Government)

The Agency's elected Board or Council holds fiduciary duties of care, loyalty, and stewardship on behalf of taxpayers. When IT contracts and investments come before the Board for approval, they must exercise appropriate due diligence. Without governance in place, individual departments present projects in isolation, and the Board lacks the information and framework to assess whether investments:

- Align with the Agency's strategic priorities
- Duplicate systems already in use or being implemented elsewhere

- Meet enterprise security and architecture standards
- Reflect true total cost of ownership (not just purchase price)
- Can be adequately supported by IT resources

IT governance provides the systematic due diligence mechanism the Board needs to fulfill their oversight responsibilities confidently and protect taxpayer interests.

In the private sector, IT decisions ultimately flow to executive leadership, the CEO, CFO, or board makes final calls about priorities and investments. The structure is hierarchical and relatively clear.

Local government is different. Authority is more diffuse. The CIO often doesn't report to the top (you might report to Finance, Administration, or a department director). Elected officials have legitimate authority over major decisions. Department heads have their own budgets and priorities. The County Executive or City Manager balances competing interests. In counties, you have elected department heads that can be very politically powerful like the Sheriff, District Attorney, and Tax Collector.

In this environment, IT decisions can't be made unilaterally by the CIO. They require stakeholder input and buy-in. Without governance, this happens ad hoc, through hallway conversations, political maneuvering, whoever complains loudest. Projects get approved based on who has the strongest relationship or best timing, not necessarily on strategic merit.

Governance provides:

A level playing field. All requests and priorities are evaluated through the same process. No one gets special treatment. People trust that decisions are fair.

Transparency. People see how decisions are made. They understand why their priority wasn't funded or why something else took precedence. Transparency reduces suspicion and politics.

Shared accountability. Decisions are made collectively by business leaders, not imposed by IT. When the governance body prioritizes work, everyone owns that decision. IT isn't the bad guy saying no, the governance body made a strategic choice.

Protection for IT leadership. When a department head is unhappy about a decision, you can point to the governance process: "The IT Governance Council evaluated this against other priorities and made this decision. If you want to revisit it, bring it back to the Council." You're not hiding behind governance, you're operating within a legitimate decision-making structure.

Appropriate authority and accountability alignment. This is perhaps governance's most important function. Without governance, CIOs are often held accountable for organizational IT outcomes while lacking authority to make the necessary decisions, departments make their own technology choices, executives override IT priorities, departments demand work that IT can't deliver. Governance creates a structure where decision authority flows through appropriate channels. The

governance body has authority to prioritize work and allocate resources; the CIO has authority to execute within those priorities; departments have input but not unilateral control. When authority matches accountability, IT can be held responsible for outcomes. When it doesn't, IT becomes the scapegoat for failures it couldn't prevent.

Strategic focus. Governance forces explicit conversations about priorities. Instead of saying yes to everything and failing to deliver, you make conscious choices about where to invest limited resources.

Better decisions. Good governance brings diverse perspectives to decisions. IT gets input from business leaders. They understand IT constraints. The resulting decisions balance technical and business considerations better than either group could achieve alone.

Communication as governance work. An insight many CIOs miss: effective governance is communication work. The governance structure creates the forums where IT and business leaders communicate about priorities, trade-offs, and value. Your governance meetings are where you translate technical possibilities into business language, where they learn to articulate needs in ways IT can act on, and where shared understanding gets built. If you view governance meetings as administrative overhead, you've missed the point. **These meetings are the work.** Alignment happens here through structured communication.

Governance is especially critical in local government because of constrained resources and competing demands.

You will never have enough money, staff, or time to do everything everyone wants. Governance provides a structured way to make those difficult trade-off decisions.

The Right-Sized Governance Model for Most Local Government IT

Large organizations need complex governance with multiple tiers, formal committees, extensive documentation. You probably don't. Over-governance is as bad as under-governance, it creates bureaucracy that slows decisions without adding value.

For mid-sized local government IT (serving populations under 500,000 with IT departments under 150 staff), I recommend a three-tier governance structure. For smaller organizations and for organizations with a more focused set of public services and thus fewer departments, a two tier or a single tier can work well.

Tier 1: IT Governance Council (Strategic)

- **Purpose:** Make strategic decisions about IT direction, major investments, and enterprise priorities
- **Membership:** County Executive/City Manager (or representative), CIO, key department heads, Finance Director
- **Frequency:** Monthly or Quarterly

- **Decisions:** Major initiatives, strategic direction, budget priorities, enterprise architecture, major policy changes

Tier 2: IT Governance Working Group(s) or Communities of Interests (Tactical)

- **Purpose:** Prioritize ongoing work, evaluate project requests
- **Membership:** CIO, IT managers, key business partners/department representatives
- **Frequency:** Monthly
- **Decisions:** Project prioritization, resource allocation, identifying digital transformation opportunities, project evaluations

Tier 3: Business Solutions Teams (Implementation)

- **Purpose:** Implement and run technology solutions, make tactical decisions
- **Membership:** IT managers, key business partners/department representatives
- **Frequency:** Monthly
- **Decisions:** Prioritizing tasks, assigning resources, establishing schedules, correcting problems

This structure balances strategic oversight with tactical agility. The Council makes sure high-level coordination happens without micromanaging. The Working Group handles regular prioritization without needing executive time.

Critically, this structure aligns authority with accountability at each tier. The Council has authority to set strategic direction and make major investment decisions, and they're accountable to executive leadership for IT's strategic contribution. The Working Group has authority to prioritize tactical work and allocate resources within strategic parameters, and they're accountable for operational execution. The CIO has authority to manage within governance decisions, and is accountable for delivery. Each level has clear authority matched to their accountability.

Making Governance Communication Effective

Governance structures are only as effective as the communication that happens within them. To make your governance forums drive real alignment:

Prepare members for participation. Don't ambush governance members with complex decisions. Circulate background materials 3–5 days before meetings. For major decisions, pre-brief key decision-makers individually. This investment in communication enables better discussions and decisions in the actual meeting.

Design for dialogue, not presentation. Your role is leading a conversation where participants shape decisions together, not presenting recommendations for rubber-stamp approval. Ask questions more than you present. "Given these trade-offs, what matters most to you?" "What concerns do you have that we haven't addressed?" "How would you prioritize these competing needs?"

Translate continuously. Most business leaders don't speak fluent IT. Your job is real-time translation between technical reality and business impact. Not "We need to upgrade our VMware infrastructure," but "Our server virtualization is reaching capacity limits. If we don't upgrade, we'll have to stop adding new systems. That means some projects you've approved can't be deployed."

Document decisions and communicate broadly. Governance decisions affect people beyond those in the meeting. Document what was decided, why, and what it means for the organization. Communicate decisions through multiple channels. Reference governance decisions when explaining why certain work is prioritized or deferred.

Close the feedback loop. When governance makes a decision, track what happens. At the next meeting, report back: "Last quarter we approved the permitting system project. Here's the progress and what we're learning." This accountability through communication makes governance real rather than theoretical.

Make the invisible visible. Governance work is often invisible to those outside the room. Make it visible. "Our Governance Council reviewed 12 project requests this quarter and prioritized these five based on strategic alignment and organizational capacity. Here's why…" This communication helps the broader organization understand how decisions get made.

The communication principle: If governance is working, people across the organization understand how IT decisions get made, why certain priorities are chosen, and how they can participate in the process. If governance is failing, it's usually a communication failure, either within governance forums or from governance to the broader organization.

Governance is communication infrastructure. The value isn't in the meetings themselves, it's in the shared understanding, aligned priorities, and trust that emerge from sustained, structured communication between IT and business leaders.

Authority and Accountability in Governance: Making It Real

The governance structure only works if authority and accountability are clearly aligned.

In practice, that means:

Governance Council Authority:

- Approve or deny major initiatives
- Set strategic IT direction and priorities
- Allocate budget across major categories
- Approve enterprise-wide policies and standards
- Resolve conflicts the Working Group can't address

Governance Council Accountability:

- To executive leadership and elected officials for IT strategic value

- For keeping IT investments in step with organizational priorities
- For providing clear direction and priorities to IT

Working Group Authority:

- Prioritize projects and work within strategic parameters
- Evaluate and recommend project requests
- Allocate resources across approved priorities
- Approve minor initiatives and tactical decisions
- Make operational policy interpretations

Working Group Accountability:

- To the Governance Council for tactical execution of strategic priorities
- For recommending sound prioritization based on organizational needs
- For monitoring project/portfolio performance

CIO Authority:

- Execute within governance-approved priorities and budget
- Make operational and technical decisions
- Manage IT staff and resources
- Implement governance decisions
- Bring issues to governance when direction is needed

CIO Accountability:

- To the Governance Council for delivering approved priorities
- For IT operational performance
- For escalating issues that need governance attention
- For executing decisions made through governance process

Individual Managers Authority:

- Execute their functional area within CIO direction
- Make operational decisions in their domain
- Recommend priorities and approaches to governance

Individual Managers Accountability:

- To the CIO for their functional area performance
- For delivering their part of governance-approved work

Notice the pattern: at each level, authority to decide matches accountability for outcomes. The Council doesn't just set priorities, they have authority to enforce them and are accountable for strategic results. The CIO doesn't just execute, they have authority to manage resources and are accountable for delivery. Nobody is held accountable for outcomes they can't control.

That's the governance structure's most important feature. It creates decision-making authority at the right levels and helps those with authority own the results.

Tier 1: IT Governance Council

Composition (typically 7–12 members):

- County Executive or City Manager (Chair, or designates representative)
- CIO
- Finance Director or CFO
- 4–6 key department heads representing major stakeholder groups:
- Public Safety (Sheriff/Police Chief)
- Human Services
- Public Works/Infrastructure
- Community Development/Planning
- Administration
- Legal Counsel (advisory, as needed)

Selection criteria for department representatives:

- Major IT consumers
- Diverse organizational perspectives
- Executive-level decision authority
- Commitment to attend regularly

Meeting cadence: Quarterly (more frequently if needed during major initiatives)

Meeting duration: 90–120 minutes

Typical agenda:

Strategic Updates (20 minutes)

- Progress on strategic initiatives
- IT performance metrics and trends
- Major environmental changes (security threats, technology shifts, regulatory changes)

Investment Priorities and Portfolio Review (40 minutes)

- Review current project portfolio status
- Evaluate new major initiative requests
- Make go/no-go decisions on proposed investments
- Adjust priorities based on changing organizational needs

Strategic Decisions (30 minutes)

- Enterprise architecture direction

- Major policy changes
- Strategic planning updates
- Risk management issues

Looking Ahead (10 minutes)

- Preview upcoming decisions
- Identify emerging issues
- Confirm next meeting date and topics

Your role as facilitator: Notice that the agenda focuses heavily on discussion and decision-making, not just information presentation. Your most important job in governance meetings is making sure everyone understands what's being decided and why, translating between technical and business language, drawing out concerns and questions, building shared understanding. Many CIOs prepare elaborate presentations for governance meetings. Better to prepare questions that spark the right conversations. The decisions that emerge from good dialogue are far more valuable than decisions made after slick presentations.

What the Council decides:

- Approval of major IT initiatives (typically those requiring significant investment or cross-departmental impact)
- Strategic IT direction and multi-year planning priorities
- Annual IT budget priorities
- Enterprise architecture decisions affecting multiple departments
- Major policy changes (security, acceptable use, data governance)
- Response to major incidents or crises affecting the organization

What they don't decide:

- Day-to-day operational decisions (that's IT management's role)
- Minor project prioritization (that's the Working Group's role)
- Technical implementation details (that's IT staff's role)

The key principle: the Council makes strategic decisions that require executive-level judgment and cross-organizational perspective. Everything else happens at lower levels.

Tier 2: IT Governance Working Group

Composition (typically 8–15 members):

- CIO (Chair)
- IT functional managers (Infrastructure, Applications, Support, Security)
- Business relationship managers or liaison roles
- Representatives from major business units (not necessarily executives, working-level people who understand operational needs)

Meeting cadence: Monthly
Meeting duration: 90 minutes

Typical agenda:

Project and Work Prioritization (40 minutes)

- Review new project requests
- Evaluate against strategic priorities and capacity
- Prioritize work for next month
- Discuss resource constraints and trade-offs

Portfolio Status Review (20 minutes)

- Current project status
- Issues and risks
- Resource allocation concerns

Tactical Decisions (20 minutes)

- Standard and framework updates
- Process improvement proposals
- Minor policy adjustments

Emerging Issues (10 minutes)

- Items that may need Council escalation
- New challenges or opportunities
- Coordination across functional areas

What the Working Group decides:

- Project prioritization and sequencing
- Resource allocation across projects
- Tactical IT standards and framework updates
- Process improvements and operational changes
- Issue resolution for cross-functional challenges

What gets escalated to Council:

- Decisions with major budget impact
- Strategic direction changes
- Issues the Working Group can't resolve (competing priorities among executives)
- Cross-organizational policy changes

The Working Group is where most prioritization happens. This is your regular rhythm for keeping work aligned with priorities and capacity.

Decision-Making Frameworks and Criteria

Governance only works if decisions are based on clear criteria, not just politics or gut feel. You need frameworks that guide evaluation.

For Major Investment Decisions (Council level):

Evaluate proposed initiatives against these criteria:

1. Strategic Alignment (30% weight)

- How well does this align with organizational strategic priorities?
- Does it advance our IT vision and strategic direction?
- Is this the right timing given other organizational initiatives?

2. Business Value (30% weight)

- What tangible benefits does this deliver? (improved service, cost savings, risk reduction, compliance)
- How many people/departments benefit?
- What's the impact if we don't do this?

3. Risk and Urgency (20% weight)

- What risks does this mitigate? (security, compliance, operational)
- What are the consequences of delay?
- Is there a critical deadline or window?

4. Feasibility and Cost (20% weight)

- Do we have the capability to execute this successfully?
- Is the cost reasonable relative to benefit?
- Are required resources available?
- What are we saying no to if we say yes to this?

Score each criterion (1–5). Calculate weighted score. This doesn't make the decision for you, but it provides structured analysis to inform decision-making.

For Project Prioritization (Working Group level):

Use a simpler framework:

High Priority: Strategic impact + Urgent timeframe + High value **Medium Priority:** Strategic value OR urgency, but not both **Low Priority:** Limited strategic value + No urgency

Plus consideration for:

- **Dependencies:** Does this unblock other work?
- **Capacity:** Do we have resources available?
- **Balance:** Are we overweighting one department or area?

These frameworks make prioritization transparent and defensible. When someone asks "Why wasn't my project funded?" you can point to the evaluation criteria and show how their request scored relative to what was prioritized.

Making Governance Work: Practical Implementation

Creating governance structures is easy. Making them work is hard. To avoid common pitfalls:

1. Start with executive sponsorship

Governance only works if leadership values it. Before creating structures, get explicit commitment from your County Executive or City Manager. Explain why governance matters, what you're proposing, and what you need from them (participation or designated authority, attendance at Council meetings, respect for governance decisions).

Without executive sponsorship, governance bodies lack authority and people ignore them.

2. Right-size the membership

Too few members and you lack diverse perspectives. Too many and meetings become unwieldy and decisions slow.

Council: 7–12 members maximum. If your organization is large, use designated representatives rather than trying to include everyone.

Working Group: 8–15 members maximum. Focus on people who regularly interact with IT and understand operational needs.

3. Run effective meetings

- **Pre-distribute materials:** Send decision papers, data, and background at least 48 hours before meetings. Meetings are for discussion and decision, not information sharing.
- **Use consent agendas:** Group routine items that don't need discussion. Approve them all at once. Focus meeting time on items requiring substantive discussion.
- **Timebox discussions:** Allocate specific time to each topic. Move forward when time expires. Don't let meetings run over.
- **Document decisions clearly:** Who decided what? What's the rationale? What are next steps? Who owns implementation? Make this immediately available after meetings.
- **Follow through:** Track decisions. Review implementation. Hold people accountable. Governance only matters if decisions lead to action.

4. Make decisions, don't just discuss

The worst governance bodies are ones where issues get discussed endlessly but never decided. Debate is good. Analysis is valuable. But at some point, you need to make a decision and move forward.

If the group can't reach consensus, the chair (typically the CIO for Working Group, County Executive or designee for Council) makes the call. But make a decision. Indecision is worse than imperfect decisions.

5. Be transparent about criteria and process

Publish your evaluation criteria. Share how decisions are made. When decisions are made, explain the rationale. Transparency builds trust that governance is fair and legitimate, not arbitrary.

6. Start light and evolve

Don't try to create perfect governance immediately. Start with basic structures and processes. Run them for 6–12 months. Learn what works. Adjust. Add sophistication gradually as the organization matures.

Over-governance kills governance. Start simple. Build complexity only when needed.

7. Enforce governance decisions

This is critical. If governance makes a decision and it's subsequently ignored or overruled through backdoor politics, governance becomes meaningless.

When someone tries to go around governance ("Can you just squeeze in this small project?"), the answer is: "Bring it to the Working Group. If it's really a priority, they'll accommodate it. But I can't unilaterally override governance."

Protecting governance decisions protects the legitimacy of the entire structure.

8. Review and adjust annually

Is governance working? Are the right people involved? Are decisions improving? Are participants satisfied with the process?

Review effectiveness annually. Adjust membership, processes, or criteria as needed. Governance should evolve with your organization.

Common Governance Pitfalls and How to Avoid Them

Pitfall 1: Governance becomes rubber-stamping

The CIO makes all real decisions, and governance bodies just approve them. This isn't governance, it's theater.

Solution: Bring actual choices to governance bodies. Present options with trade-offs. Ask for input before decisions are made. Give members real influence.

Pitfall 2: Governance becomes bureaucratic obstacle

Every small decision requires committee approval. Nothing moves without extensive process. Agility disappears.

Solution: Clearly define what requires governance approval (strategic/major decisions) versus what IT can decide autonomously (tactical/operational decisions). Push decisions to the lowest appropriate level.

Pitfall 3: Governance lacks teeth

Decisions are made but not followed. Resources aren't actually allocated. Priorities aren't actually enforced.

Solution: Connect governance to budget and resource allocation. What governance prioritizes actually happens. What governance deprioritizes doesn't get resources. Make decisions consequential.

Pitfall 4: Wrong people participate

Governance includes people who don't understand IT or don't have authority. Decisions lack legitimacy or get overruled.

Solution: Make sure participants have both understanding and authority. For Council, this means executive-level people. For Working Group, this means people who work with IT regularly and understand operational needs.

Pitfall 5: Governance becomes adversarial

IT versus business. Departments fighting each other. Decisions made politically rather than strategically.

Solution: Frame governance as collaborative problem-solving, not competition. Limited resources are the constraint, not IT being difficult. Everyone's trying to optimize for organizational good, not departmental interests.

Pitfall 6: Governance meetings are poorly run

Endless discussion. No decisions. Meetings run over. People stop attending.

Solution: Run disciplined meetings. Use pre-reads. Timebox discussions. Make decisions. Document and follow through. Make meetings valuable enough that attendance is worthwhile.

Governance Tools and Templates

Effective governance requires supporting tools and processes:

1. Project Request Template

Standardized format for submitting project requests makes sure you have consistent information for evaluation:

- ***Project name and sponsor***
- ***Business problem or opportunity addressed***
- ***Proposed solution (high-level)***
- ***Expected benefits (quantified where possible)***
- ***Cost estimate (including IT staff time)***
- ***Resource requirements (IT staff, vendor, infrastructure)***
- ***Timeline and key milestones***
- ***Risks and dependencies***
- ***Strategic alignment (how this connects to organizational priorities)***

2. Decision Paper Format

For major decisions requiring Council input:

- **Issue/Decision Required** (one paragraph summary)
- **Background/Context** (why this matters now)
- **Options Analysis** (2–4 options with pros/cons)
- **Recommendation** (specific proposal with rationale)
- **Implementation Plan** (next steps if approved)
- **Financial Impact** (costs and budget source)

Keep decision papers to 2–3 pages maximum. Busy executives won't read long documents.

3. Portfolio Dashboard

Visual representation of current project portfolio showing:

- Active projects with status (green/yellow/red)
- Resource allocation by project
- Timeline and milestones
- Benefits tracking
- Capacity available for new work

Update monthly. Share with governance bodies. Provides transparency about what IT is working on and capacity constraints.

4. Decision Log

Document all governance decisions:

- Date and decision-making body
- Issue decided
- Decision made
- Rationale
- Implementation owner and timeline
- Status/outcome

You get institutional memory and accountability.

Governance Maturity Is an Ongoing Process

Don't expect perfect governance immediately. Like any organizational capability, governance matures over time.

Level 1: Ad Hoc (Where most organizations start)

- No formal governance structure
- Decisions made reactively or politically
- No clear prioritization process
- IT often becomes scapegoat for difficult trade-offs

Level 2: Basic Structure (First step improvement)

- Governance bodies established
- Regular meetings scheduled
- Basic prioritization criteria defined
- Decisions documented

Level 3: Functioning Governance (Target for most mid-sized organizations)

- Governance bodies meet regularly and make real decisions
- Clear criteria guide decision-making
- People trust the process
- Portfolio management is transparent
- Decisions are enforced and followed through

Level 4: Optimized Governance (Aspiration)

- Governance is embedded in organizational culture
- Processes are efficient and valued
- Strategic and tactical governance are tightly integrated
- Continuous improvement based on outcomes
- Governance enables agility rather than slowing it

Most mid-sized local government IT organizations should target Level 3. Level 4 is aspirational and requires organizational maturity that takes years to develop.

Focus on making progress. If you're at Level 1, building to Level 2 is huge improvement. From Level 2 to Level 3 takes ongoing effort but is achievable within 12–24 months.

The CIO's Role in Governance

As CIO, governance requires specific responsibilities from you:

You're the architect. Design governance structures appropriate to your organization. Too light and they won't be effective. Too heavy and they'll be ignored.

You're the facilitator. Run governance meetings effectively. Make sure decisions get made. Document outcomes. Follow through on implementation.

You're the translator. Help business leaders understand IT constraints and options. Help IT understand business priorities and context. Bridge the gap.

You're the protector. Enforce governance decisions. Don't let them be undermined through backdoor politics. Maintain the integrity of the process.

You're the educator. Help people understand why governance matters and how to participate effectively. Build governance literacy across the organization.

But you're not the dictator. Governance decisions should be collaborative, not unilateral. Your role is to facilitate good decisions, not impose your preferences.

The best CIOs use governance to distribute decision-making authority while maintaining strategic coherence. They give departments the room to make good decisions within clear frameworks.

The Takeaway

Governance is how you make sure IT resources flow to what matters most. Without it, you're reactive, political, and constantly firefighting. With it, you're strategic, transparent, and focused on delivering value.

Yes, governance requires time, meetings, documentation, process. But the alternative is worse: wasted effort on low-priority work, stakeholder frustration, political battles over resources, inability to execute strategy.

Good governance doesn't slow you down. It focuses you. It keeps you focused on the right work. It builds organizational trust that IT is being strategic, not arbitrary.

You don't need perfect governance. You need good enough governance, structures, and processes that bring the right people together to make strategic decisions with clear criteria and accountability.

Start where you are. Build basic structures. Run them consistently. Adjust based on what works. Over time, governance becomes how your organization naturally operates, not an extra burden, but the way strategic IT decisions get made.

That's when governance stops feeling like overhead and starts feeling like what actually moves the organization forward.

How This Connects to the Broader Framework

Governance is the mechanism through which strategic alignment happens:

Effective governance draws heavily on your Module 1 leadership skills:

- **Political navigation** (Section 1.4) enables you to build stakeholder consensus and manage competing interests
- **Communication** (Section 1.5) helps you articulate why governance matters and facilitate effective governance meetings
    - **Time prioritization** (Section 1.2) frees you up for the governance work that's easy to skip
    - ***Purpose clarity (Section 1.1)*** keeps governance grounded in why IT exists, not just process for its own sake

The organizational health you built in Module 2 makes governance possible:

- **Leadership team** (Section 2.1) operates the governance working group
- **Vision** (Section 2.2) provides criteria for evaluating priorities
- **Structure** (Section 2.3) determines who participates in governance

- **Communications** (Section 2.6) carries governance decisions throughout the organization

Rest of Module 3 depends on governance:

- **Strategic planning** (Section 3.2) is informed and approved through governance
- **Frameworks** (Section 3.3) are established through governance decisions
- **Service portfolio** (Section 3.4) is defined through governance
- **Budget** (Section 3.5) is allocated based on governance priorities

Modules 4 and 5: Without governance deciding what gets improved and funding it, service excellence stalls and improvement stays theoretical.

Governance drives strategic coordination across every other area. When decision-making breaks down, so does everything downstream.

Key Takeaways

- Governance is structured decision-making about priorities, investments, and resources, not bureaucracy
- Two-tier model works for most mid-sized organizations: strategic Council (quarterly) and tactical Working Group (monthly)
- Clear evaluation criteria make prioritization transparent and defensible
- Governance only works if decisions are enforced and followed through
- Start simple and evolve, don't try to create perfect governance immediately
- CIO's role is to facilitate good decisions, not dictate them
- Governance creates shared accountability and protects IT from being the "department of no"
- Common pitfalls include rubber-stamping, bureaucracy, lack of enforcement, and poorly run meetings
- Governance maturity develops over time, target functioning governance (Level 3) as reasonable goal

Reflection Questions

Assess your current governance maturity:

1. How do major IT investment decisions currently get made in your organization?
2. Can you describe your IT prioritization process to a department head? Would they find it fair and transparent?
3. When was the last time you said no to a project request based on clear prioritization criteria rather than just "we don't have capacity"?
4. Do people outside IT understand how IT decisions are made and feel they have appropriate input?

5. If two department heads both want their project prioritized, how do you resolve that conflict?
6. What percentage of your "committed" projects get completed versus getting interrupted by new urgent priorities?
7. Do you have regular forums where leaders collectively make decisions about IT priorities, or is it all one-on-one negotiations?

The working documents for this section are in Appendix A.3.1.

Section 3.2

Strategic Planning

About two years into maturing our new IT governance structure, I realized we had a new problem. We were making good decisions about priorities, governance was working. But we were still reactive at our core. We were choosing among projects that departments brought to us. We weren't driving our own strategic agenda.

Our governance council would meet, review requests, prioritize them. Good. But where was IT's vision for the future? Where was our multi-year roadmap? What were we actively building toward, not just responding to?

I realized we had tactics but not strategy. We had governance but not strategic planning.

That's when we started building our IT strategic plan. Not the kind of plan that sits on a shelf gathering dust. A living plan that guided investment decisions, shaped our initiatives, and gave us our own agenda instead of just reacting to what others wanted.

Suddenly we had a narrative about where IT was going. We had a multi-year roadmap that everyone could understand and align with. We had a structure for evaluating whether new requests fit our strategic direction. We had a basis for proposing initiatives that would move the organization forward, not just responding to requests.

Strategic planning turned us from reactive order-takers into partners with our own agenda for organizational capability.

This section addresses that gap.

What Strategic Planning Is

Strategic planning is the process of defining where you want IT to go over the next 2–4 years and creating a roadmap to get there. It translates organizational

strategy into IT strategy and provides direction for investment, capability building, and technology evolution.

Strategic planning is NOT:

- A one-time document you create and file away
- A wish list of every technology you'd like to implement
- Something you do in isolation from organizational strategy
- A detailed project plan with every task defined years in advance
- An academic exercise disconnected from reality

Strategic planning IS:

- A multi-year direction that guides decisions and investment
- In step with organizational priorities and mission
- Based on realistic assessment of capacity and constraints
- Flexible enough to adjust as circumstances change
- A living document that's reviewed and updated regularly
- A communication tool that builds organizational understanding

The goal isn't to predict the future perfectly. The goal is to have a clear direction so that day-to-day decisions accumulate into progress toward concrete goals, rather than random activity that doesn't build toward anything.

Organizations with clear, actively used strategic plans outperform those without them across multiple dimensions. IT organizations with actively managed strategic plans consistently achieve higher initiative success rates and use their resources better.

Why Many IT Organizations Don't Have Real Strategic Plans

So why don't more IT organizations have real strategic plans? Several obstacles get in the way:

Because it requires dedicated time. Strategic planning can't happen in the gaps between operational work. It requires focused time for assessment, stakeholder engagement, analysis, and planning. Most IT leaders are too buried in operations to create that time.

Because it requires looking beyond the immediate. When you're firefighting constantly, thinking 2–4 years ahead feels impossible. Strategic planning requires stepping back from daily urgency to think about multi-year direction.

Because real planning surfaces uncomfortable trade-offs. Real strategic planning surfaces the gap between what you'd like to accomplish and what's feasible. It requires acknowledging constraints and making tough priority decisions. Many leaders avoid this discomfort.

Because past planning efforts failed. Many IT leaders have created strategic plans that ended up on shelves, ignored. They're skeptical that planning is worth the effort. "We created a plan three years ago and never looked at it again. Why bother?"

Because organizational strategy is unclear. If the county or city doesn't have clear strategic direction, it's hard to align IT strategy. You're planning in a vacuum. Many IT leaders wait for organizational clarity that never comes.

Because leaders resist commitment. Strategic planning requires leaders to articulate priorities and commit to multi-year direction. Some prefer to keep options open, which prevents strategic planning.

None of these obstacles are permanent. The solution is right-sized strategic planning, substantive enough to guide decisions, light enough to be achievable and maintainable.

The Right-Sized Strategic Plan for Local Government IT

You don't need a 100-page strategic plan. You need a clear, practical plan that guides decisions and can be communicated effectively.

Core components of an effective IT strategic plan:

1. Strategic Context (2–3 pages)

- Current organizational environment and priorities
- Key technology trends affecting local government
- Current state assessment: Where is IT today? What's working? What's not?
- Strategic imperatives: What must IT accomplish to serve organizational mission?

2. IT Vision and Strategic Goals (2–3 pages)

- Where IT is headed in 2–4 years
- 3–5 strategic goals that guide all IT work
- How IT strategy aligns with organizational strategy
- Success metrics: How will we know we're making progress?

3. Strategic Initiatives (5–10 pages)

- Major multi-year initiatives that advance strategic goals
- For each initiative: purpose, scope, timeline, dependencies, resource requirements
- Roadmap showing how initiatives sequence and interrelate
- Portfolio view showing balance across goals

4. Enabling Strategies (3–5 pages)

- Infrastructure modernization strategy
- Application portfolio strategy
- Security and risk management strategy
- Workforce development strategy
- Operational excellence strategy

5. Implementation Approach (2–3 pages)

- Governance connection: How strategy translates to annual priorities
- Resource requirements and budget implications
- Risk management approach
- How the plan will be monitored, reviewed, and updated

Total: 15–25 pages. Thorough enough to be useful. Concise enough to be read and used.

Plus supporting appendices as needed: current state details, detailed initiative descriptions, technology standards, etc.

The Strategic Planning Process

Creating a strategic plan requires structured process, typically taking 3–6 months from initiation to approval:

Phase 1: Preparation and Assessment (4–6 weeks)

Secure executive sponsorship. Your County Executive or City Manager needs to support strategic planning and commit to the process. Without executive buy-in, the plan lacks authority.

Assemble planning team. Typically your IT leadership team plus key business partners. Not everyone needs to be involved in every step, but strategic planning can't be done by CIO alone.

Conduct current state assessment. Where is IT today?

- Service delivery performance and gaps
- Technology portfolio (infrastructure, applications, security)
- IT organization capabilities and capacity
- Customer satisfaction and pain points
- Financial baseline

Environmental scan. What's happening in the world that affects IT strategy?

- Organizational strategic priorities and initiatives
- Technology trends in local government
- Emerging threats and opportunities
- Regulatory and compliance requirements
- Resource constraints and opportunities

Business input. Interview or survey key leaders:

- What's working well with IT?
- What needs improvement?
- What are your priorities for the next 2–4 years?
- What's your vision for how technology should enable your work?

This assessment grounds your strategic planning. You can't plan effectively without understanding where you are and what's needed.

Phase 2: Strategy Development (4–6 weeks)

Define strategic goals. Based on assessment and stakeholder input, what are the 3–5 strategic goals that should guide IT over the next 2–4 years?

Strategic goals should be:

- **In step with organizational priorities** (not just IT-focused)
- **Substantive and significant** (not just "keep doing what we're doing")
- **Achievable with ongoing effort** (not fantasy)
- **Measurable** (you can track progress)

Example strategic goals:

- "Transform citizen service delivery through digital channels"
- "Build a modern, secure, resilient IT infrastructure"
- "Establish IT as a strategic partner through improved governance and service delivery"
- "Develop a high-performing IT workforce with capabilities for the future"
- "Strengthen cybersecurity posture to protect critical assets and data"

Identify strategic initiatives. What major multi-year efforts will advance these goals?

For each strategic goal, identify 2–4 major initiatives. These are substantial efforts requiring significant investment and multiple years to complete.

Example initiatives supporting "Transform citizen service delivery":

- Implement citizen portal for online service requests and payments
- Modernize permitting and licensing systems
- Establish data analytics capability for service improvement
- Deploy mobile solutions for field service delivery

Develop enabling strategies. What core work is required to support strategic initiatives?

- Infrastructure modernization (cloud migration, network upgrades, data center strategy)
- Application portfolio rationalization (retire, replace, retain decisions)
- Security enhancement (zero trust, identity management, incident response)
- IT service management improvement (ITIL implementation, service catalog)
- Workforce development (capability building, succession planning)

Create roadmap. Sequence initiatives and enabling work across 2–4 years:

- What happens in Year 1? Year 2? Year 3?
- What are dependencies? (What must happen before other things can start?)
- How does this align with budget cycles?
- What's the balance across different goals and areas?

Phase 3: Validation and Refinement (3–4 weeks)

Socialize the draft broadly. Share draft plan with:

- IT leadership team (do they see themselves in this? Can they execute it?)
- Key business partners (does this address their priorities?)
- Executive leadership (does this align with organizational direction?)

Gather feedback. Adjust as needed.

Validate feasibility. Reality-check the plan:

- Resource requirements: Is this achievable with realistic budget and staffing?
- Timeline: Is this sequencing realistic given dependencies and constraints?
- Risk: What could derail this? How do we mitigate?

Better to adjust expectations now than commit to unrealistic plans that erode credibility.

Refine financial implications. What does this strategy require financially?

- Multi-year budget projections
- Major capital investments and timing
- Operating cost implications
- Potential funding sources or budget increases needed

Be realistic. Strategic plans that ignore financial reality don't get executed.

Phase 4: Approval and Communication (2–3 weeks)

Governance approval. Take the strategic plan through your governance structure:

- IT Governance Working Group review and input
- IT Governance Council formal approval
- Board or executive briefing as appropriate

Governance approval creates ownership and commitment.

Communication to broader organization. Once approved, communicate the plan:

- All-staff presentation to IT team
- Executive summary distributed to leadership
- Briefings to key departments
- Publication on intranet or website

Make the plan accessible. People can't align with strategy they don't know about.

Phase 5: Execution and Maintenance (Ongoing)

Translate strategy to annual plans. Each year, define what from the strategic plan will be accomplished:

- Which initiatives start or continue?
- What enabling work gets prioritized?
- How does this translate to budget requests?

Monitor progress. Track execution:

- Quarterly reviews of strategic initiative status
- Annual full review of plan progress
- Metrics tracking for strategic goals

Adjust as needed. Strategy isn't static:

- Annual updates to reflect changing priorities or circumstances
- Major refresh every 3 years
- Flexibility to adjust as organizational needs change

Strategic planning isn't a one-time event. It's an ongoing practice of setting direction, executing toward it, learning, and adjusting.

Strategic Goals: Getting This Right

The most critical element of strategic planning is defining the right strategic goals. These goals guide everything else. Miss on these, and the entire plan lacks direction.

Characteristics of effective strategic goals:

Outcome-focused, not activity-focused. Bad: "Implement cloud infrastructure" Good: "Build modern, resilient infrastructure that supports organizational agility"

The bad example is an activity. The good example is an outcome that might be achieved through cloud but keeps focus on what you're trying to accomplish, not just what you're doing.

Balanced across different strategic needs. Don't make all goals about infrastructure or all about applications. Balance across:

- Customer-facing improvements (citizen service, internal support)
- Internal capability building (infrastructure, security, workforce)
- Operational excellence (service delivery, process improvement)

Limited in number. 3–5 strategic goals maximum. More than that and you lose focus. Strategic goals should represent your biggest priorities, not everything you might want to do.

Measurable with clear success indicators. For each goal, define how you'll know you're making progress:

- Specific metrics (e.g., "increase stakeholder satisfaction from 68% to 85%")
- Milestones (e.g., "migrate 75% of applications to cloud by Year 3")
- Outcomes (e.g., "reduce major incidents by 40%")

Connected to organizational priorities. Every strategic goal should tie back to organizational mission or priorities. If you can't explain why a goal matters to the organization (not just to IT), it's probably not strategic.

Strategic Initiatives: From Goals to Action

Strategic initiatives are how you accomplish strategic goals. These are the major multi-year efforts that move you forward.

Defining effective strategic initiatives:

Clear scope and boundaries. What's included? What's not? Be specific enough that people understand what the initiative covers.

Defined timeline. Multi-year initiatives need phasing:

- Phase 1 (Year 1): Assessment and foundation
- Phase 2 (Year 2): Implementation and rollout
- Phase 3 (Year 3): Optimization and expansion

Resource requirements. What does this need?

- IT staff time (often the most constrained resource)
- Budget (capital and operating)
- Vendor support
- Business leader involvement

Dependencies and risks. What must happen first? What could derail this? How do you mitigate risks?

Expected outcomes and benefits. Why is this worth doing? What value does it deliver? Be specific.

Governance and ownership. Who owns initiative success? How are decisions made? How is progress monitored?

For each strategic initiative, create a one-page charter covering these elements. This makes sure initiatives are well-defined before significant resources are committed.

Aligning IT Strategy with Organizational Strategy

IT strategy doesn't exist in vacuum. It must align with and enable organizational strategy.

If your organization has a clear strategic plan:

This is ideal. Map your IT strategic goals directly to organizational strategic goals. Show explicitly how IT strategy enables organizational strategy.

Example:

- Organizational goal: "Improve constituent service and engagement"
- IT goal: "Transform citizen service delivery through digital channels"
- Connection: Digital service delivery directly enables improved constituent experience

If your organization doesn't have a clear strategic plan:

This is common, especially in smaller local governments. Don't wait for perfect organizational clarity. Instead:

Start with mission. What's the organization's fundamental purpose? How does IT enable that mission?

Identify known priorities. Even without formal strategic plan, leadership has priorities. What are they? Align IT strategy with those.

Anticipate future needs. Based on trends in local government and your specific community, what will the organization need from IT in 3–5 years?

Create your own clarity. IT strategy can help drive organizational strategy. By articulating a clear direction for IT, you may help the broader organization think more strategically.

The key principle: IT strategy should serve organizational goals, not exist for its own sake. Technology is a means, not an end.

The Strategic Roadmap: Visualizing the Journey

A strategic roadmap translates your plan from text into a visual timeline that leaders can quickly understand.

Effective roadmap characteristics:

Time-phased across 3–5 years. Shows what happens when. Typically organized by year or by quarter for the first year.

Organized by strategic goal. Groups initiatives under the goals they support. Shows balance across goals.

Shows dependencies. Arrows or notes indicating what must complete before other things can start.

Includes major milestones. Key decision points, completions, go-live dates.

Resource-aware. Consider showing resource loading, how much capacity is consumed in each period. This makes trade-offs visible.

Living document. Updated regularly to reflect progress and changes.

Format options:

Gantt-style roadmap: Timeline with bars showing initiative duration and sequencing. Good for detailed planning.

Swim-lane roadmap: Strategic goals as swim lanes, initiatives as blocks within lanes across timeline. Good for showing balance and coordination.

Portfolio view: All initiatives shown with status, timeline, resource requirements. Good for governance review.

Use the format that communicates most effectively to your audience. The visual should tell the story at a glance, with detail available as needed.

Making Strategic Planning Work

Many strategic plans fail because they're never actively used, not because the plans themselves are flawed. To make your plan drive action:

1. Connect strategy to annual planning

Each year, explicitly translate strategic plan into annual priorities:

- Which strategic initiatives are active this year?
- What enabling work gets prioritized?
- How does this translate to budget requests and resource allocation?

Your annual IT plan should be the strategic plan's current-year implementation. This makes sure strategy drives real work, not just exists as separate document.

2. Use strategy in governance decisions

When evaluating new requests or prioritizing work, ask: "How does this advance our strategic goals?" Requests that don't support strategy should be deprioritized or declined. That way, governance decisions accumulate toward strategic direction.

3. Monitor and report progress regularly

Quarterly at minimum, review strategic initiative status:

- What progress was made?
- Are timelines on track?
- What obstacles emerged?
- Do we need to adjust?

Share progress broadly. Transparency builds credibility and maintains focus.

4. Keep the plan visible

- Reference it in meetings and communications
- Display roadmap in common areas
- Include in onboarding for new staff
- Share with leadership regularly

Plans that sit in drawers don't drive behavior. Plans that are constantly referenced do.

5. Update annually, refresh every 3 years

Annual updates: Adjust for changed circumstances, completed work, new priorities. Shift the planning horizon forward (2–4 years from current date, not fixed end date).

Major refresh: Every 3 years, conduct a thorough strategic planning process. The world changes. Your organization changes. Your plan should too.

6. Celebrate strategic wins

When strategic initiatives complete or major milestones are achieved, celebrate visibly. This reinforces that strategy is real and progress is being made.

Common Strategic Planning Mistakes

Mistake 1: Planning in isolation

Creating strategy without stakeholder input produces plans that don't address real needs and lack buy-in.

Solution: Engage business leaders throughout planning. Their input makes the plan better and creates ownership.

Mistake 2: Too much detail too far out

Trying to define specific projects and tasks years in advance. The future is uncertain, detailed plans become quickly outdated.

Solution: Plan directionally for outer years. Detail only the next 12–18 months. Add detail as you get closer.

Mistake 3: Ignoring resource constraints

Creating ambitious plans that require resources you'll never have. This produces cynicism when plans don't execute.

Solution: Be realistic about capacity and budget. Better to accomplish a modest realistic plan than fail at an ambitious unrealistic one.

Mistake 4: Writing the plan and walking away

Treating strategic planning as one-time event. Creating document, filing it, never referencing it again.

Solution: Make the plan a living tool. Reference it constantly. Update it regularly. Use it to drive decisions.

Mistake 5: Strategy disconnected from operations

Strategic plan existing separate from actual work. Day-to-day operations continue unchanged despite strategy.

Solution: Explicitly connect strategy to annual plans, governance decisions, and budget allocation. Make strategy operational.

Mistake 6: No accountability for execution

Nobody owns strategic initiative success. Progress isn't tracked. Failures aren't addressed.

Solution: Assign clear owners for initiatives. Monitor progress. Hold people accountable for execution.

Mistake 7: Inflexible adherence to the plan

Refusing to adjust even when circumstances change significantly. "The plan says we're doing this, so we're doing it."

Solution: Strategy provides direction, not straitjacket. Be willing to adjust when learning or circumstances warrant it.

Strategic Planning for Different Organizational Sizes

Strategic planning approach should scale with organization size:

Small IT organizations (5–15 staff):

- Simpler, shorter plans (10–15 pages)
- Fewer strategic initiatives (3–5 major efforts)
- More flexible and adaptable
- CIO can lead planning with input from team and key partners

- Annual updates may be sufficient

Mid-sized IT organizations (15–40 staff):

- More thorough plans (15–25 pages)
- Balanced portfolio of initiatives (6–10 major efforts)
- More structured planning process involving leadership team
- Quarterly monitoring and annual updates
- This is the target audience for frameworks in this section

Larger IT organizations (40+ staff):

- More detailed plans with sub-strategies for major areas
- Larger portfolio with more sophisticated portfolio management
- More formal planning processes and cycles
- May need dedicated strategy or PMO function
- More frequent monitoring and adjustment

Scale your approach to match your organization's complexity and capacity.

The CIO's Role in Strategic Planning

As CIO, strategic planning requires specific leadership:

Your role spans the full cycle: setting the vision for where IT should go, designing and driving the planning process, and bringing diverse perspectives in to build shared ownership.

You're also the reality-checker and the executor: keeping plans grounded in what's feasible, making strategy understandable enough that people connect their daily work to it, and then driving implementation through to results.

But strategic planning shouldn't be a solo effort. Engage your leadership team. Involve partners. Create shared ownership. Strategy you develop alone lacks buy-in and misses important perspectives.

Creating a Strategic Anchor

Strategic planning provides direction in a world of competing demands and limited resources. Without it, you're reactive, responding to whoever asks loudest, starting initiatives you never finish, wondering why you're always busy but never making real progress.

With strategic planning, you have a clear direction. You know where you're going and why. You can evaluate requests against strategic direction. You can prioritize work that advances strategy and decline work that doesn't. You can tell a coherent story about IT's direction that builds organizational confidence.

You don't need perfect planning. You need good enough planning, clear strategic goals, defined initiatives, realistic roadmap, connection to budget and governance.

Start where you are. If you've never done strategic planning, start simple. Three strategic goals. Five major initiatives. Basic roadmap. Build from there.

You don't need a perfect plan. You need a clear enough direction that daily decisions add up to something real.

Strategic direction is what turns IT from reactive order-taker into a partner driving organizational capability forward.

How This Connects to the Broader Framework

Strategic planning is where leadership capability, organizational health, and operational discipline converge:

Your Module 1 leadership competencies make strategic planning possible:

- **Purpose clarity** (Section 1.1) anchors your IT strategy to community outcomes, not technical ambition
- **Time prioritization** (Section 1.2) gives you bandwidth for strategic thinking and planning
- **Political navigation** (Section 1.4) helps you build stakeholder coordination around strategy
- **Communication** (Section 1.5) enables you to articulate strategy compellingly

Your Module 2 organizational health work is the foundation for executing strategy:

- **Leadership team** (Section 2.1) develops and executes strategy together
- **Vision** (Section 2.2) aligns with and informs strategic planning
- **Capable people** (Section 2.4) are required to execute strategic initiatives
- **Culture** (Section 2.5) determines whether strategic change succeeds
- **Communications** (Section 2.6) carries strategic direction throughout the organization

Earlier in Module 3:

- **Governance** (Section 3.1) approves strategy and translates it into priorities and budget allocation
- **Rest of Module 3** flows from strategic planning:
- **Frameworks** (Section 3.3) implement strategic direction for architecture and standards
- **Service portfolio** (Section 3.4) reflects strategic service priorities
- **Budget** (Section 3.5) allocates resources to strategic priorities

Modules 4 and 5: Strategy tells you what to deliver well and what to improve. Service delivery and improvement execute that direction.

Strategic planning translates vision into action and keeps organizational effort pointed toward concrete goals.

Key Takeaways

- Strategic planning defines 2–4 year direction and creates roadmap to get there
- Effective plans are 15–25 pages: thorough enough to guide, concise enough to use
- Planning process takes 3–6 months: assessment, strategy development, validation, approval, communication
- Strategic goals (3–5) should be outcome-focused, balanced, measurable, and in step with organizational priorities
- Strategic initiatives are major multi-year efforts that advance strategic goals
- Roadmaps visualize strategy across time and make sequencing and dependencies clear
- Plans must be actively used, connected to governance, annual planning, and budget
- Annual updates and major refresh every 3 years keep strategy relevant
- Common mistakes: planning in isolation, too much detail, ignoring constraints, writing the plan and walking away
- CIO role: vision-setter, process leader, bridge-builder, reality-checker, communicator, executor

Reflection Questions

Assess your strategic planning maturity:

1. Can you articulate IT's 2–4 year direction in a compelling way that others understand?
2. Do you have 3–5 clear strategic goals that guide all IT work and investment?
3. Are your strategic initiatives well-defined with clear scope, timeline, resources, and owners?
4. How often do you reference your strategic plan when making decisions about priorities and investments?
5. When was the last time you communicated IT strategy beyond IT?
6. Can your IT staff explain how their work connects to strategic goals?
7. How does your strategic plan influence your annual budget requests and resource allocation?

The working documents for this section are in Appendix A.3.2.

Section 3.3

Frameworks and Standards

I was about six months into implementing our incident management process when one of my senior technicians pulled me aside. "Can I be honest?" he said. "This new process you're making us follow? It's slowing us down. We used to just fix things. Now we have to document everything, fill out forms, categorize incidents. It feels like bureaucracy."

He wasn't wrong about the documentation burden. But he was missing something critical: before we had the process, we were fixing the same problems repeatedly. We had no visibility into patterns. We couldn't identify systemic issues. We were reactive and inefficient, even if it felt fast in the moment.

I realized I'd made a classic mistake: I'd implemented a framework without explaining why it mattered. I'd focused on the "what" (follow this process) without communicating the "why" (so we can identify patterns, prevent recurrence, and work smarter instead of harder).

That conversation led to a reset. We simplified the process to what mattered. We showed the team the data, how incident tracking was revealing patterns we could address before they became incidents. We explained how proper change management prevented outages. We showed value instead of just demanding compliance.

Six months later, that same technician told me: "I get it now. This makes our lives easier, not harder."

This section covers understanding which frameworks and standards matter for local government IT, why they matter, and how to implement them in ways that add value without creating bureaucracy.

The Framework Paradox

The paradox every IT leader faces: frameworks and standards are necessary for organizational maturity and effectiveness. But implemented poorly, they become bureaucratic obstacles that frustrate staff and slow work.

Without frameworks and standards:

- Every situation is handled differently by different people
- Knowledge lives in people's heads and leaves when they leave
- You can't improve what you don't measure or document
- Incidents recur because root causes aren't addressed
- Changes create unintended consequences
- Security is inconsistent and ad hoc
- New staff have no documented approach to learn from

With poorly implemented frameworks:

- Processes become more important than outcomes
- Documentation exists for compliance, not value
- Forms and approvals slow everything down
- People find workarounds to avoid "the process"
- Frameworks feel like they're imposed by IT for IT's benefit
- Actual work happens despite the process, not because of it

With well-implemented frameworks:

- Consistency without rigidity
- Documentation that adds value by capturing knowledge
- Processes that make work easier and more effective
- Clear expectations for how work gets done
- Ability to learn from experience and improve systematically
- Foundation for organizational maturity and capability

The goal isn't to avoid frameworks. The goal is to implement them at the right level, enough structure to create consistency and enable improvement, not so much that they become bureaucratic burdens.

What Frameworks and Standards Are

Let me clarify terminology, because these terms get used interchangeably but mean different things:

Framework: A structured approach to a particular discipline or process. Frameworks provide methodology, not prescriptive rules. Examples: NIST Cybersecurity Framework, ITIL for service management, enterprise architecture frameworks.

Standard: A specific requirement or specification that applies consistently. Standards are more prescriptive than frameworks. Examples: "All laptops must use

full-disk encryption," "All changes require approval before implementation," "We use Microsoft 365 for productivity software."

Process: A documented series of steps for accomplishing specific work. Processes implement frameworks and standards. Examples: incident management process, change approval process, onboarding process.

Procedure: Detailed instructions for executing specific tasks. Procedures support processes. Examples: "How to reset a password," "How to provision a new laptop," "How to restore from backup."

Most IT organizations need:

- **A few key frameworks** to guide major areas (service management, security, architecture)
- **A reasonable set of standards** to maintain consistency without constraining flexibility
- **Well-documented processes** for critical recurring work
- **Procedures** for common technical tasks

Right-size each level for your organization. Too little and you lack consistency. Too much and you create bureaucracy.

The NIST Cybersecurity Framework: Essential for Local Government

If you implement only one framework, make it the NIST Cybersecurity Framework (CSF). Here's why: many local governments must complete the National Cybersecurity Review to receive Homeland Security grants from FEMA. Even if you're not pursuing those grants, NIST CSF has become the de facto standard for cybersecurity in government.

What NIST CSF provides:

An approach that organizes cybersecurity activities into five core functions:

1. **Identify** - Understand your assets, risks, and vulnerabilities. You need to know what you're protecting, what matters most to your mission, and where your vulnerabilities lie.
2. **Protect** - Implement safeguards to ensure delivery of services. This includes access controls, training, data protection, and protective technology.
3. **Detect** - Implement activities to identify cybersecurity events. You need monitoring and detection capabilities to know when something's wrong.
4. **Respond** - Take action regarding detected cybersecurity incidents. Have plans for response, analysis, mitigation, and communication.
5. **Recover** - Maintain plans for resilience and restore capabilities. Recovery planning, improvements based on lessons learned, and coordination.

Why NIST CSF works for local government:

It's risk-based, not prescriptive. CSF doesn't mandate specific technologies or controls. It provides a framework for understanding and managing cyber risk based on your specific environment and priorities. This flexibility is essential for government where resources are constrained and environments vary widely.

It's outcome-focused. CSF emphasizes what you're trying to accomplish (protect critical assets, detect incidents quickly, respond effectively) rather than checking boxes on compliance lists.

It's designed for communication. CSF provides language that translates between technical security work and executive risk management. You can use CSF to communicate security posture to your County Executive or Board in terms they understand.

It's free and vendor-neutral. Unlike some frameworks that require expensive certifications or favor specific vendors, NIST CSF is freely available and technology-agnostic.

It maps to other frameworks. If you're required to comply with other security frameworks or regulations, CSF provides a useful organizing structure that can incorporate those requirements.

Your role as IT leader with NIST CSF:

You don't need to become a NIST CSF expert. Your security team or designated security lead needs deep understanding. But as IT leader, you need to understand:

Where you are today. Use CSF to assess your current cybersecurity posture across the five functions. Many organizations use maturity tiers (1–4) to assess current state. Most mid-sized local governments operate at Tier 2–3 across different areas. That's normal. The goal isn't perfection, it's knowing where you are.

Where you need to be. Not every function needs to be at the highest maturity level. Be strategic about where to invest based on your risk profile and mission criticality.

Your improvement roadmap. What are priority gaps to address? This becomes part of your strategic plan and gets resourced through governance.

How to communicate about security. Use CSF language to explain security posture and investment needs to non-technical leadership. Instead of "We need a SIEM solution," say "We're currently Tier 2 for Detect functions, which means we have limited ability to identify security incidents before they become breaches. Investing in security monitoring tools moves us to Tier 3, enabling threat detection before incidents become breaches."

For implementation details: The NIST CSF website (nist.gov/cyberframework) provides implementation guidance, assessment tools, and resources. Many states also offer cybersecurity assistance programs that can help with CSF implementation.

For the National Cybersecurity Review: If you're required to complete this for FEMA grants, CSF provides the structure for the review. Treat the review not as compliance exercise but as valuable self-assessment that informs your security roadmap and justifies security investments to leadership.

Organizations using structured frameworks like NIST CSF report significantly fewer successful breaches and faster incident response times compared to organizations without frameworks. The value isn't in the framework itself, it's in the discipline and consistency it creates.

Essential IT Service Management (ITSM) Processes

Beyond security, every IT organization needs basic service management processes. You don't need to implement all of ITIL (the comprehensive IT service management framework with dozens of processes). But you do need fundamentals.

Why ITSM processes matter:

Without structured service management processes, IT operates reactively and inconsistently. With them, you have:

- Predictable, consistent service delivery
- Ability to learn from incidents and prevent recurrence
- Controlled change that minimizes service disruption
- Data to identify patterns and improve systematically
- Clear expectations for staff and business partners

The three critical ITSM processes every IT organization needs:

Your leadership role with ITSM: You're not implementing these processes yourself, your managers and technical staff do that work. Your role is making sure your organization has these practices in place and that they support service excellence rather than create bureaucracy. You establish the why, resource the work, and hold people accountable for outcomes.

1. Incident Management

Why this matters strategically: Without structured incident management, your organization is reactive and inefficient. You're fixing the same problems repeatedly without learning. You can't answer basic questions like "What's our most common type of failure?" or "Are incidents trending up or down?" You lack data to justify improvement investments or staffing decisions.

Your leadership responsibility: make sure your service desk or operations team has a clear incident management process that balances speed of restoration with learning from failures. The process should define severity levels (what constitutes a critical vs. minor incident), establish response expectations that customers can count on, and capture enough data to identify patterns.

Key leadership principle: Incident management focuses on restoring service quickly. Root cause analysis is separate (problem management, below). Your job is

making sure people understand this distinction, don't let root cause investigation slow incident resolution.

Decision point: What severity levels matter in your environment? What response times can you commit to? Who handles escalations? These are leadership decisions that technical staff need you to make or approve.

Where to learn more: ITIL Incident Management guidance (available through AXELOS website) or ServiceNow's ITSM resources provide detailed implementation guidance.

2. Change Management

Why this matters strategically: Research shows most service outages result from poorly managed changes. When you lack change management, you can't answer leadership questions about why systems went down or what you're doing to prevent recurrence. More critically, without change governance, you can't balance the pace of change (which departments want) against stability (which operations needs).

Your leadership responsibility: Establish the governance structure that categorizes changes by risk and defines who approves what. At its heart, this is about balancing competing values: innovation requires change, but uncontrolled change creates disruption. Your job is creating the framework that enables appropriate change while managing risk.

Key leadership decision: Change management should enable work, not slow it down. The most common failure is requiring heavyweight process for low-risk changes. Your leadership challenge is matching the process to the risk, simple approval for simple changes, thorough review for complex changes.

What you must decide: Who has authority to approve different types of changes? What defines a standard change that doesn't need case-by-case review? What constitutes emergency that bypasses normal process? These governance decisions set the tone for how change management works.

3. Problem Management

Why this matters strategically: Incident management is tactical, fix this problem now. Problem management is strategic, stop this category of problems from recurring. Without problem management, you're trapped in reactive mode indefinitely. With it, you systematically reduce your incident load and free capacity for strategic work.

Your leadership responsibility: Create organizational discipline around learning from failures. This isn't a technical challenge, it's a cultural and governance challenge. You must allocate time for root cause investigation (which feels less urgent than incident response). You must protect that investigation time when operational pressures mount. You must track investigations to completion and hold people accountable for implementing fixes.

Key leadership principle: Not every incident deserves root cause analysis, that would paralyze your team. Your job is establishing the threshold: What patterns

matter enough to investigate? What's your tolerance for recurring minor issues versus investing time in elimination? This is a resource allocation decision only you can make.

Governance integration: Problem management should be a standing agenda item in your leadership team meetings. Review incident patterns monthly. Assign investigation ownership. Track to completion. This organizational discipline is what transforms problem management from an aspiration to a capability.

Integrating ITSM processes:

These three processes work together as a system:

- Incident management restores service quickly
- Change management prevents incidents caused by uncontrolled changes
- Problem management prevents incidents from recurring

Implement them as integrated practices, not separate bureaucratic silos. Your goal is organizational capability, not process compliance.

Beyond the basics: ITIL includes many other processes (Request Fulfillment, Service Level Management, Configuration Management, etc.). Consider these as your organization matures, but start with the critical three. You can learn more at the official ITIL website (axelos.com/certifications/itil-service-management) or through industry organizations like HDI (thinkhdi.com).

Technology Standards: Creating Consistency Without Constraint

Technology standards define what technology choices are approved or required in your organization. Standards create consistency, simplify support, enable bulk purchasing, and reduce complexity.

Why technology standards matter:

Reduce support complexity. Fewer platforms means less expertise required, easier to maintain knowledge as staff turn over, and more efficient problem resolution.

Enable economies of scale. Standardization enables better pricing through volume purchases and reduces licensing complexity.

Improve security. Fewer platforms means more thorough security configuration, easier patching and updates, and better security monitoring.

Simplify integration. Fewer platforms means fewer integration points and more predictable integration patterns.

Make staff transitions easier. New staff encounter familiar technology. Cross-training is easier. Knowledge transfer is simpler.

Your role as IT leader with standards:

Understand the purpose. Standards exist to create value, not for their own sake. When a standard no longer serves its purpose, it should change.

Balance standardization with flexibility. Too much standardization stifles necessary innovation and prevents legitimate business needs. Too little creates chaos. The balance is having clear standards with reasonable exception processes.

Key areas requiring standards:

End-user computing: Standard laptop/desktop models, operating systems, productivity software, mobile devices, remote access methods.

Infrastructure and platforms: Server operating systems, virtualization, cloud providers and policies, network equipment, storage, backup, and DR solutions.

Applications: Enterprise application platforms (ERP, HR, financials), development standards if you develop custom applications, integration patterns.

Security technologies: Endpoint protection, email security, network security, identity and access management, encryption requirements.

Creating and maintaining standards:

Your leadership role with technology standards:

Standards represent significant governance decisions: you're constraining choice to create consistency. This trades innovation flexibility for operational efficiency and cost management. That's a strategic trade-off requiring leadership judgment, not a technical decision.

Key leadership decisions:

Where to standardize. You can't standardize everything, that would prevent necessary innovation and legitimate business needs. Where does standardization create most value? Typically: end-user computing (consistency improves support), infrastructure platforms (interoperability and skill reuse), and security technologies (consistent protection). Your job is deciding the boundaries.

Exception governance. Standards without exception processes breed workarounds and resentment. But exceptions without governance destroy standards. You must establish who can approve exceptions and under what circumstances. This authority should match accountability, those approving exceptions must own the support and integration consequences.

Review and evolution. Technology changes rapidly. Standards that aren't reviewed annually become obsolete, teaching staff that standards don't matter. Make standards review a governance responsibility, your IT Governance Working Group should review annually, recommend updates, and bring significant changes to your Governance Council.

Communication strategy. Standards must be discoverable when people need them. You'll need to invest in a knowledge management approach. Your role is making sure this capability exists, not maintaining the standards documentation yourself.

Cultural message. How you implement standards sends cultural signals. Imposed standards with rigid enforcement signal distrust. Collaboratively developed

standards with clear rationale signal respect for professional judgment. Your involvement sets the tone.

Data Governance: Why It Matters

Data is increasingly critical, for operations, decision-making, public transparency, artificial intelligence projects, and general service delivery. Yet many local governments lack structured approaches to managing data as an asset.

Why data governance matters:

Data quality affects everything. Poor data quality leads to bad decisions, inefficient operations, citizen frustration, and compliance risk. Data governance keeps data accurate, complete, and trustworthy.

Security and privacy are mandatory. Data breaches create legal liability, public trust damage, and operational disruption. Data governance helps appropriate protection based on sensitivity.

Regulatory compliance is complex. Public records laws, privacy regulations, retention requirements, compliance requires structured approach to data management.

Data is an organizational asset. Like any asset, it requires stewardship, someone accountable for quality, access, protection, and appropriate use.

Your strategic role with data governance:

Data governance is an organizational challenge, not a technical one. Your role as IT leader is political and structural: you must negotiate shared responsibility between IT (which provides infrastructure and technical controls) and business units (which own data content and usage rules).

Key leadership challenge: Most organizations default to either IT owns everything (which fails because IT doesn't understand business context) or departments do whatever they want (which creates security risks and integration nightmares). Your job is building the third way: shared governance with clear accountability.

The governance question: Who has authority to decide what data is collected, how it's protected, who can access it, how long it's retained? These are organizational policy questions requiring stakeholder input, not technical questions. Your role is creating the governance forum where these decisions get made and ensuring IT has a seat at that table.

Critical strategic decisions you must influence:

Data ownership accountability. Data isn't orphaned, every data domain needs an organizational owner accountable for quality and appropriate use. This is typically a department head or senior leader, not an IT person. Your role is working with executive leadership to establish these accountabilities, because IT can't own business data we don't generate or control.

Data classification framework. Not all data has same sensitivity. Establish classification levels (Public, Internal, Confidential, Restricted) with protection requirements for each.

Access management approach. How are access decisions made? What's the process for granting, reviewing, and revoking access?

Data retention and disposal. What data is kept how long? When and how is it disposed of? This requires balancing legal requirements, operational needs, and risk.

Integration with IT governance. Data-related decisions and policies should flow through your governance structure.

Starting data governance in your organization:

Don't try to govern everything at once. Start with high-value or high-risk data domains. Identify the 3–5 data domains that matter most, either critical to operations or presenting significant risk if mismanaged.

Use existing governance mechanisms. Data governance decisions can flow through your IT Governance Council or Working Group. Don't create separate governance bureaucracy unless organization size justifies it.

Focus on practical outcomes, not process. The goal is better data quality, appropriate protection, and reduced risk, not creating data governance bureaucracy.

Build incrementally. Start with basic policies and practices. Mature them over time as organizational capability grows.

Where to learn more: The Data Governance Institute (datagovernance.com) provides frameworks and resources. DAMA International's DMBOK (Data Management Body of Knowledge) is the definitive reference for data management practices. For government-specific guidance, the Data Foundation and GovEx provide resources for the public sector.

Architecture Principles: Decision-Making Framework

You don't need full enterprise architecture practice with elaborate frameworks like TOGAF or Zachman. Those are designed for large, complex enterprises. But you do need architecture principles, high-level guidelines that shape technology decisions consistently.

Why architecture principles matter:

Without principles, every technology decision is made from scratch. Different people make different choices. Technology portfolio becomes fragmented and difficult to manage. Integration becomes complex. Support burden grows.

Architecture principles provide consistency without detailed specifications. They're the "rules of the road" for technology decisions.

What you need as IT leader:

A short list (5–8 principles) that guide how technology decisions get made. These should be:

- **Memorable** (people can remember and apply them)
- **Practical** (they guide real decisions)
    - ***Consistent with organizational priorities***
    - ***Flexible enough to allow exceptions when justified***

Example architecture principles for local government:

Cloud-first approach: "Evaluate new applications and services for cloud deployment first. On-premises deployment requires justification."

Buy before build: "Prefer commercial solutions over custom development unless requirements or total cost of ownership favor custom."

API-first integration: "New systems must provide documented APIs. Avoid point-to-point custom integrations."

Security by design: "Consider security requirements at project start, not at end. All systems must meet minimum security standards."

Mobile-responsive by default: "Citizen-facing services must work on mobile devices."

Data portability: "Avoid proprietary data formats that create vendor lock-in."

Your role with architecture principles:

Develop principles collaboratively. Involve technical staff and key business partners. Principles affect how projects are executed, get input from people who will live with them.

Keep the list short. 5–8 principles maximum. More than that and people can't remember them.

Document rationale. Why does each principle exist? This helps people understand when to follow strictly versus when exceptions are appropriate.

Review annually. Technology and organizational needs change. Principles should evolve.

Reference in governance. When evaluating projects, explicitly check against architecture principles. This makes them real, not just wall decorations.

Where to learn more: While TOGAF is too heavy for most local governments, the core concepts are valuable. The Open Group (opengroup.org) provides resources on architecture principles. For government-specific guidance, the Federal Enterprise Architecture Framework (available through whitehouse.gov) provides accessible principles that scale to local government.

Making Frameworks Work Without Creating Bureaucracy

That's the critical question: how do you implement frameworks and standards that add value without creating bureaucratic burden?

Key principles for implementation:

1. Start with why

Always explain why a framework or standard matters before imposing it. When people understand purpose, they're more likely to embrace it. "We're implementing change management not to slow you down, but to prevent outages caused by uncoordinated changes. Last quarter, 70% of our outages were change-related. This process helps us manage that risk."

2. Right-size for your organization

Don't implement enterprise-scale frameworks in mid-sized organizations. Extract the essential elements that provide value. Skip the parts that create overhead without benefit.

3. Build incrementally

Start with basics. Show value. Build credibility. Then add sophistication gradually. Don't try to implement perfect frameworks immediately.

4. Focus on outcomes, not process compliance

The goal is better service, lower risk, improved efficiency, not following processes for their own sake. If a process isn't delivering value, simplify or eliminate it.

5. Make it easy to do the right thing

Good processes should make work easier, not harder. If people are finding workarounds, the process is too burdensome or isn't adding value.

6. Get feedback and adjust

Regularly ask staff: "Is this process helping or hurting? What would make it better?" Adjust based on feedback. Frameworks should evolve based on experience.

7. Celebrate wins and show value

When frameworks deliver value, incident management identified a pattern that led to permanent fix, change management prevented an outage, standards enabled faster support, celebrate it. Make the value visible.

8. Lead by example

If you expect staff to follow processes, you must follow them too. Leaders who skip processes because they're "too busy" undermine the entire framework.

Common Mistakes to Avoid

Mistake 1: Implementing frameworks because you're "supposed to"

Frameworks should solve real problems. If you can't articulate what problem a structure solves, don't implement it.

Mistake 2: Copying enterprise approaches without adaptation

What works for Fortune 500 companies doesn't work for local government with 75 IT staff. Right-size everything.

Mistake 3: Creating process without providing tools

If you require incident documentation but don't provide a reasonable ticketing system, compliance will be poor. Process needs supporting tools.

Mistake 4: Implementing everything at once

Start with highest-value frameworks. Build incrementally. Don't overwhelm your organization.

Mistake 5: Never adjusting frameworks once implemented

Frameworks should evolve based on experience and changing needs. Annual review and adjustment is essential.

Mistake 6: Treating frameworks as an IT-only concern

Many frameworks (especially data governance) require business involvement. Don't try to implement as an IT-only initiative.

Mistake 7: Focusing on documentation over outcomes

Documentation should serve the work, not become the work. If people are spending more time documenting than doing, something's wrong.

What This Means

Frameworks and standards create organizational maturity and capability. They transform IT from ad hoc firefighting to systematic service delivery. They enable learning, improvement, and consistency.

But frameworks must be implemented thoughtfully, at the right scale, with clear purpose, focused on value rather than compliance.

You don't need to implement everything. Focus on:

- **NIST CSF** for security (especially if pursuing FEMA grants)
- **Essential ITSM processes** (Incident, Change, Problem Management)
- **Technology standards** in key areas
- **Basic data governance** for high-value/high-risk data
- **Architecture principles** to guide decisions

Start with these foundations. Build incrementally. Show value. Adjust based on experience. Over time, frameworks become how you naturally operate, not extra burden, but embedded capability.

That's when frameworks stop feeling like overhead and start feeling like what makes everything else possible.

How This Connects to the Broader Framework

Frameworks and standards provide the operational discipline that makes governance decisions stick and services run reliably:

Implementing frameworks depends on the leadership skills from Module 1:

- **Communication** (Section 1.5) helps you explain why frameworks matter and build buy-in
- **Time prioritization** (Section 1.2) protects time for the framework implementation work that operational urgency crowds out
- **Political navigation** (Section 1.4) matters most when frameworks face resistance, and they will

The healthy organization from Module 2 is what makes frameworks take hold:

- **Culture** (Section 2.5) determines whether people embrace frameworks or resist them
- **Communications** (Section 2.6) carries framework implementation and value messaging
- **People development** (Section 2.4) builds capability to execute frameworks effectively

Earlier in Module 3:

- **Governance** (Section 3.1) approves and enforces frameworks and standards
- **Strategic planning** (Section 3.2) includes framework implementation as a strategic initiative

Rest of Module 3 depends on frameworks:

- **Service portfolio** (Section 3.4) requires ITSM processes to manage services effectively
- **Budget** (Section 3.5) allocates resources to framework implementation

Modules 4 and 5: Consistent service and measurable improvement both need the operational discipline that frameworks provide

Key Takeaways

- Frameworks create consistency and enable improvement, but must be right-sized to add value without bureaucracy
- NIST Cybersecurity Framework is essential for local government (FEMA grant requirements and industry standard)
- Three critical ITSM processes: Incident Management, Change Management, Problem Management
- Technology standards reduce complexity and cost but require balance between consistency and flexibility
- Data governance is organizational challenge requiring business ownership, not just IT technical controls

- Architecture principles guide technology decisions without requiring detailed specifications
- Implementation success requires: clear purpose, right-sizing, incremental build, focus on outcomes, feedback, and adjustment
- Common mistakes: copying enterprise approaches, implementing without tools, never adjusting, focusing on documentation over outcomes

Reflection Questions

Assess your frameworks and standards maturity:

1. Do you use NIST Cybersecurity Framework to assess and communicate security posture? If not, why not?
2. Do you have documented processes for Incident, Change, and Problem Management that staff follow?
3. Can you articulate your technology standards in key areas? Are they documented and enforced?
4. Who owns data governance in your organization? Is it clear who's accountable for data quality and protection?
5. Do you have architecture principles that guide technology decisions? Can your staff articulate them?
6. When you implement frameworks, do you explain why they matter or just mandate compliance?
7. How often do you review frameworks and standards so that they're still adding value?

The working documents for this section are in Appendix A.3.3.

Section 3.4

Services and Products

I was in a meeting with our Public Works Director when he said something that stopped me cold: "I didn't know IT could do that. If I'd known that was an option, I would have asked for it two years ago."

We'd just shown him a mobile solution another department was using for field inspections. Public Works had a nearly identical need, inspectors in the field needing to access and update records. But they'd never asked for it because they didn't know it was possible. They assumed IT only handled desktop computers, email, and keeping servers running.

That moment hit me hard. We had capabilities our customers didn't know about. And our customers had needs we didn't know about. The gap wasn't technical, it was communication and awareness.

I realized we'd been operating in a deeply flawed way: IT decided what services to offer based on what we thought was important. Customers either used what we provided or found workarounds. When they asked for something we hadn't thought of, we often said no because "that's not what we do."

We had it backwards. Our job wasn't to decide what services the organization needed. Our job was to understand what our customers needed and figure out how to provide it, or help them understand what was possible.

That realization led to a complete shift in how we thought about Services and Products. We created a service catalog so customers knew what we offered. We engaged them in deciding what services to provide. We involved them in selecting products and technologies. We stopped being the department that said "here's what you get" and started being partners who asked "what do you need and how can we help?"

The transformation wasn't immediate. But over time, it changed how customers experienced IT. We went from being seen as gatekeepers to being seen as enablers. From being the "department of no" to being strategic partners.

This section walks through how to get there.

The Fundamental Problem: The Alignment Gap

Many IT organizations operate with a fundamental disconnect between what IT provides and what customers need. This gap shows up in several ways:

IT doesn't know what customers need. You're providing services based on what you think is important, not what customers have told you they need. You're reacting to specific requests but not paying attention to broader needs.

Customers don't know what IT offers. They make assumptions about IT capabilities based on limited experience. They don't ask for things they need because they don't know IT could provide them. Or they assume IT can't help with their challenges because "IT just does computers."

IT selects products unilaterally. You choose technology based on technical criteria, what's most elegant architecturally, what fits your preferred platforms, what's easiest for IT to support. Customer needs are secondary considerations, if they're considered at all.

Customers work around IT. When IT doesn't provide what they need or takes too long, customers find their own solutions, shadow IT, external vendors, manual workarounds. The result is security risks, cost inefficiency, and integration headaches.

Satisfaction suffers despite good work. IT might be delivering services reliably, but if they're not the services customers need, satisfaction remains low. You're answering the wrong questions well.

This misalignment is nobody's fault. It's systemic. IT and customers operate in different worlds with different perspectives and vocabularies. Without deliberate mechanisms to bridge that gap, misalignment is inevitable.

Better technology won't fix this. Neither will more resources. What fixes it is better coordination, making sure IT provides services customers actually need, and involving customers in selecting how those services are delivered.

The Mindset Shift: From Provider to Partner

Fixing the alignment gap requires a fundamental shift in how IT leadership thinks about the role of IT.

The old mindset: IT as provider

In this model, IT decides what services to offer based on:

- What IT thinks is important
- What IT has expertise in
- What fits IT's technical architecture
- What IT can support efficiently

- What aligns with IT best practices

Customers are passive recipients. They get what IT provides. If they need something different, they must convince IT to add it, which is often difficult because IT has already decided what's important.

This mindset creates an adversarial dynamic. IT sees customer requests as demands to be managed. Customers see IT as obstacle to getting what they need. Both sides become frustrated.

The new mindset: IT as partner and advisor

In this model, customers and IT collaborate to determine what services should be provided:

- Customers articulate their needs and priorities
- IT helps customers understand what's possible
- Together, they evaluate options and trade-offs
- IT advises on technical feasibility, cost, and implications
- Customers make informed decisions about what services they need
- IT implements and supports those decisions

That's a collaborative dynamic. IT serves customer needs while providing expertise. Customers get services aligned with their priorities while understanding technical constraints. Both sides work toward shared goals.

Why this shift is difficult

This mindset shift is easier said than done. IT leaders need to:

Give up control. You're no longer deciding unilaterally what services to provide. You're letting customers drive those decisions. This can feel uncomfortable, especially when customers want things you think are unwise.

Accept disagreement with decisions. Customers might choose products you wouldn't have chosen. They might prioritize services differently than you would. You have to be comfortable advising against something but implementing it if customers decide that's what they need.

Become educators and translators. Your role shifts from decision-maker to advisor. You help customers understand options, implications, and trade-offs. You translate technical complexity into business language. It demands different skills than traditional IT management.

Invest in understanding customer needs. You can't be a good advisor if you don't understand customer challenges and priorities. It takes time spent with customers, learning their work, understanding their pain points.

Balance customer needs with organizational constraints. You still have responsibilities for security, cost management, architectural coherence. Customer preferences don't override these. But they're primary inputs, not secondary considerations.

Why this shift is worth it

When you make this shift successfully, several things happen:

Alignment improves markedly. IT provides services customers need because customers told you what they need.

Satisfaction increases. Even when you can't provide everything customers want, satisfaction improves because they feel heard and understand why certain things aren't feasible.

Shadow IT decreases. When customers trust IT to help solve their problems, they're less likely to go around you.

Strategic partnership emerges. You stop being the "computer department" and become a strategic partner helping the organization accomplish its mission through technology.

IT credibility strengthens. When you consistently deliver what customers need, credibility and trust build. This makes future initiatives easier.

Your job becomes more fulfilling. Being a strategic partner is more rewarding than being an order-taker or a gatekeeper.

This mindset shift drives the practices that follow in this section. Service catalogs, customer engagement in selection, lifecycle management, these are all mechanisms for operationalizing the partner mindset.

Creating a Customer-Focused Service Catalog

A service catalog is a published, accessible directory of services IT provides. It's the answer to "What does IT do?" and "How do I request it?"

Why a service catalog matters

Creates transparency. Customers can see what IT offers. They don't have to guess or make assumptions.

Sets expectations. Each service description includes what's provided, what's not, how to request it, and what to expect for response times.

Reduces confusion. Clear service definitions prevent misunderstandings about what IT will provide.

Enables self-service. When customers know what services exist and how to request them, they can self-serve without calling IT for guidance.

Provides foundation for metrics. You can track requests by service, measure satisfaction by service, and identify patterns in what customers need.

Most IT organizations don't have real service catalogs. They might have internal lists of what IT supports. But they don't have customer-facing, accessible directories that customers use.

What goes in a service catalog

Your catalog should include every service IT provides to customers. Organize services in ways that make sense to customers, not to IT.

Common service categories for local government IT:

End-User Services

- Desktop/laptop setup and support
- Mobile device setup and support
- Software installation and licensing
- Printer and peripheral support
- Account management (password resets, access requests)

Communication and Collaboration Services

- Email and calendar
- Shared drives and document management
- Video conferencing
- Instant messaging and chat
- Intranet and collaboration platforms

Application Services

- Enterprise applications (ERP, HR, financial systems)
- Department-specific applications
- Custom application development and support
- Application integration

Infrastructure Services

- Server hosting and management
- Network connectivity
- Cloud services
- Database services
- Backup and disaster recovery

Security Services

- Security awareness training
- Security incident response
- Access control and authentication
- Compliance support
- Security assessments

Project Services

- New system implementation
- Application development
- Infrastructure projects
- Process automation

How to describe each service

For each service in your catalog, provide:

Service name: Clear, customer-friendly name. Not "Active Directory account provisioning", "Create new user account."

Description: What this service provides in plain language. Focus on what the customer gets, not technical details.

Who it's for: Which employees or departments can request this service.

How to request: Specific instructions, phone number, email address, web portal, form to complete.

What you'll need to provide: Information required to fulfill the request (for new account: employee name, department, manager, start date, etc.).

Response time: When can they expect fulfillment? ("New accounts created within 24 hours of request with complete information.")

Support hours: When is support available for this service?

Related services: Links to related services they might also need.

Example service description:

Service: Laptop Setup for New Employee

Description: Complete laptop setup including operating system, standard software, security configuration, and account access. Laptop will be ready for employee's first day.

Who can request: Department managers or HR for new employees

How to request: Submit ticket through IT Service Portal or email servicedesk@county.gov with subject "New Employee Laptop"

Information needed:

- Employee name
- Department and location
- Manager name
- Start date
- Special software requirements (if any)

Response time: Laptop ready by employee start date if requested at least 3 business days in advance

Support hours: Standard support 7 AM - 6 PM Monday-Friday

Related services: New User Account Creation, Software Installation, Mobile Device Setup

Cost: Included in standard IT services (no charge to department)

This level of detail removes ambiguity and sets clear expectations.

Where to publish your service catalog

The catalog must be easily accessible to customers. Options:

Intranet page: Dedicated section of your organizational intranet with searchable service listings.

IT service portal: If you have a ticketing system with customer-facing portal, integrate the catalog so customers can browse services and submit requests directly.

Printed directory: Some organizations create printed service directories distributed to all departments. Less common now but useful for less tech-savvy users.

SharePoint or collaboration platform: Published on your organization's document sharing platform.

PDF on shared drive: Minimal option but better than nothing, a single PDF that's easy to find and search.

The best option depends on your organization's technology and culture. The key is making it easy to find and use. If customers have to hunt for the catalog, they won't use it.

Maintaining the service catalog

A service catalog is not a one-time project and requires ongoing maintenance:

Assign ownership. Someone owns the catalog, typically someone in IT management or service delivery role. They keep it current.

Review quarterly. At least quarterly, review all service descriptions for accuracy. Do response times reflect reality? Have request processes changed? Are descriptions still clear?

Update when services change. When you add, remove, or modify services, update the catalog immediately. Outdated catalogs lose credibility quickly.

Gather feedback. Ask customers: "Is the service catalog useful? What would make it better?" Adjust based on feedback.

Promote it. Regularly remind customers the catalog exists. Reference it in communications. Include it in onboarding for new employees.

Starting your service catalog

If you don't have a service catalog, start simple:

Phase 1: Document your top 10–15 most-requested services. Don't try to catalog everything. Focus on services customers use most.

Phase 2: Publish it somewhere accessible. Even a simple webpage or shared document is better than nothing.

Phase 3: Socialize it. Tell customers it exists. Walk department heads through it. Make it part of your IT governance communication.

Phase 4: Gather feedback and adjust. After 2–3 months, ask customers what's working and what's not. Refine.

Phase 5: Expand gradually. Add more services over time until you've documented everything IT provides.

Don't let perfect be the enemy of good. A simple catalog that customers use is better than a complete catalog that's too complex to maintain or too difficult to work through.

Understanding What Customers Need

You can't provide services that align with customer needs if you don't understand what customers need. It takes deliberate, ongoing engagement.

Why IT often doesn't know customer needs

Different priorities. IT focuses on infrastructure, security, and reliability. Customers focus on their mission work. Without deliberate connection, these priorities don't naturally align.

Different language. IT speaks technical language. Customers speak business language. Misunderstandings are common.

Limited interaction. IT might interact with customers only when something breaks or when they need something. You don't see their daily work, understand their challenges, or know their aspirations.

Assumptions. IT makes assumptions about what customers need based on technical perspective. Customers make assumptions about what IT can provide based on limited exposure.

Reactive relationship. IT responds to requests but doesn't ask first, "What are you trying to accomplish? How can we help?"

How to understand customer needs systematically

Regular stakeholder meetings. Schedule recurring meetings (monthly or quarterly) with key department leaders. Not just to report on IT activities, to understand their challenges, priorities, and how technology could help.

Ask questions like:

- "What are your department's priorities this year?"
- "What's frustrating about current systems or processes?"
- "What would make your team more effective?"
- "What are you seeing in other organizations that you wish you had?"
- "Where does technology create obstacles for you?"

Listen more than talk. Your goal is learning, not selling.

Annual customer surveys. Survey customers about their experience with IT and their future needs. Include questions about:

- Satisfaction with current services
- Services they wish IT provided
- Technology challenges they face
- Priorities for IT investment

Keep surveys short (10–15 questions). High participation is more valuable than exhaustive questions.

Business process observation. Periodically spend time observing how customers do their work. Watch them interact with systems. Understand their

workflows. You'll identify inefficiencies and opportunities you'd never discover through conversations.

This is especially valuable before major system selections. Understanding actual workflows prevents selecting systems that don't match how people work.

Department liaison roles. For larger organizations, consider creating business relationship manager or department liaison roles, IT staff who work closely with specific departments, understand their needs, and advocate for them within IT.

For smaller organizations, assign each IT manager responsibility for relationships with specific departments.

Governance engagement. Your IT Governance Council includes department heads. Use these meetings not just for decision-making but for understanding needs. "What's on your horizon? What challenges are you facing?"

Informal touchpoints. Don't make all engagement formal. Coffee conversations, hallway interactions, lunch meetings, informal engagement often surfaces insights formal meetings miss.

Why this engagement matters

When you systematically engage with customers to understand needs:

You discover opportunities. Customers tell you about challenges that technology could address, but only if you ask.

You build relationships. Regular engagement creates trust. Customers see IT as partner, not just service provider.

You prevent misalignment. You understand priorities before making investment decisions, not after you've committed resources to wrong things.

You become strategic. You can propose solutions to challenges customers face before they ask, not just reactively respond to their requests.

This engagement doesn't happen by accident and requires deliberate time investment. But it's essential to genuine customer focus, because you can't serve customers you don't understand.

Customer-Driven Service Selection

Once you understand customer needs, the next step is involving customers in deciding what services IT should provide. This is where governance and customer engagement come together.

Why customers should drive service selection

They know their needs best. IT can advise on technology solutions, but customers know what problems need solving and what outcomes they need.

They're accountable for outcomes. Departments are responsible for their mission work. If IT provides services that don't support that mission, IT has failed, regardless of technical excellence.

They control much of the budget. In many organizations, departments have their own budgets that could fund services. If IT doesn't provide needed services, departments will find alternatives.

Their buy-in determines success. Services selected without customer input often fail to gain adoption. Services selected with customer involvement have built-in support.

How to involve customers in service selection

Through IT Governance Council. Your governance structure should include department representatives. When considering new services or significant changes to existing services, bring the decision to the Council.

Present options:

- "Three departments have requested mobile field data collection capability. Here are three approaches with different cost and functionality trade-offs. Which approach best meets needs given budget constraints?"

IT provides technical analysis and recommendations. Customers make the decision based on their priorities.

Department-specific decisions. Some services are department-specific. For these, work directly with the department to select solutions.

Example: Sheriff's Office needs new Records Management System. IT doesn't unilaterally select the system. IT supports evaluation process, provides technical guidance, manages procurement, but Sheriff's Office staff make the selection based on their operational needs.

Pilot programs with customer input. Before committing to new services organization-wide, pilot them with representative customer groups. Gather feedback. Adjust based on what you learn. This makes sure services meet real needs before scaling.

Regular service portfolio review. Annually, review your entire service portfolio with governance body members. Ask:

- "Which services are most valuable?"
- "Which services should we enhance?"
- "Which services should we sunset or replace?"
- "What new services should we consider?"

This makes sure your service portfolio evolves with changing needs, not just accumulates services indefinitely.

Balancing customer preferences with organizational constraints

Customer-driven doesn't mean customer-dictated. You still have responsibilities:

Security and compliance. Customer preferences can't override security requirements or legal compliance. When they conflict, explain clearly why constraints exist.

Architectural coherence. You need to manage technical debt and integration complexity. When customer preferences would create significant architectural problems, explain the implications and work toward acceptable compromise.

Cost management. Budget is limited. When customer wants exceed budget, guide trade-off discussions: "We can provide A or B with current budget, not both. Which is higher priority?"

Resource capacity. You have limited staff capacity. Be transparent: "We can take on two major new services this year given current capacity. Help us prioritize."

Your role is bringing these constraints into decision-making transparently, not using them as excuses to ignore customer needs.

Product Selection with Customer Participation

Product selection, choosing specific technology products and vendors, is where customer involvement often breaks down. IT tends to view this as purely technical decision. But customers should participate, especially for products they'll use directly.

Why customers should participate in product selection

They'll use it. End-users know what workflows and features matter for their daily work. IT knows technical architecture. Both perspectives are essential.

Adoption depends on fit. Products selected without user input often fail adoption. Users find them cumbersome, missing key features, or incompatible with how they work. Forcing adoption creates resentment.

They have unique requirements. Different departments have specialized needs. Public Safety needs different capabilities than Planning. Finance needs different capabilities than HR. Generic "one size fits all" selections often fit nobody well.

Credibility and trust. When customers participate in selection and see their input valued, they trust IT more and are more committed to implementation success.

How to involve customers in product evaluation

Form evaluation committees. For major product selections, create evaluation committees that include:

- IT staff (technical evaluation, architecture fit)
- End-users (workflow fit, usability)
- Department leadership (strategic fit, budget approval)
- Others as appropriate

The committee collectively evaluates options and makes recommendations to governance for final decision.

Use structured evaluation criteria. Develop evaluation criteria collaboratively that balance technical and business considerations:

Technical criteria (IT focus):

- Architecture fit

- Security and compliance
- Integration capabilities
- Scaling and performance
- Vendor stability and support
- Total cost of ownership

Business criteria (Customer focus):

- Functionality match to requirements
- Usability and user experience
- Training and change management needs
- Workflow coordination
- Mobile capabilities
- Reporting and analytics

Weight criteria based on what matters most for this particular selection. For citizen-facing applications, usability might outweigh architecture. For backend infrastructure, architecture might outweigh interface.

Conduct hands-on evaluation. Don't select products based solely on demos and documentation. Get products into users' hands:

Proof of concept (POC): For major selections, conduct POC with representative users using the product with real data and workflows.

Product trials: Use free trial periods to test products in your environment with real users.

Site visits: Visit other organizations using products you're considering. Talk to their users, not just their IT staff. Learn what works and what doesn't.

User testing: Have representative users interact with products and provide feedback. Their practical experience often reveals issues demonstrations miss.

Use transparent scoring. Score products against criteria and share results with evaluation committee. Transparency builds trust in the process.

If Product A scores highest on technical criteria but Product B scores highest on business criteria, that surfaces important trade-offs for discussion rather than hiding them in IT's decision-making black box.

Document the decision rationale. When selection is made, document why:

- What products were evaluated
- What criteria were used
- How products scored
- What factors drove final decision
- What trade-offs were made

This creates institutional memory and helps explain the decision to people who weren't involved in evaluation.

IT's role in product selection

Your role as IT is:

Guide the process (organize evaluation, coordinate POCs, manage vendor relationships)
Provide technical expertise (assess architecture fit, security, integration challenges)
Ensure rigor (structured evaluation, documented criteria, thorough testing)
Advise on implications (cost, supportability, risks)
Implement the decision (even if it's not what you would have chosen)

You're advisor and facilitator, not sole decision-maker.

When IT must override customer preferences

Sometimes customer preferences conflict with organizational constraints:

Security risk: "This product has known security vulnerabilities that create unacceptable risk."

Architectural impossibility: "This product can't integrate with our core systems without massive custom development."

Unsupportable technology: "We don't have expertise to support this platform and can't acquire it reasonably."

Prohibitive cost: "This product is 3x budget with no funding source."

When this happens, explain clearly why the preference can't be accommodated. Then work collaboratively to find alternatives that address customer needs within constraints.

Don't just say no. Say "Here's why that won't work, and here are alternatives that might meet your needs within our constraints."

Technology Lifecycle Management with Customer Transparency

Technology has lifecycles. Hardware ages. Software reaches end-of-support. Platforms need replacement. Managing these lifecycles requires transparency with customers.

Why lifecycle management matters

Prevents crisis replacements. Planned replacements are controlled and minimally disruptive. Emergency replacements when systems fail are chaotic and expensive.

Enables budget planning. Knowing what needs replacement when enables multi-year budget planning. Surprises strain budgets.

Maintains security and reliability. End-of-life systems create security vulnerabilities and reliability problems. Staying ahead through lifecycle management prevents this.

Manages customer expectations. When customers understand replacement timelines and reasons, they're partners in transitions rather than victims of unwanted change.

Common lifecycle areas

End-user hardware: Desktop, laptops, mobile devices typically need replacement every 3–5 years as they age, slow down, and reach end of warranty support.

Servers and infrastructure: Servers typically have 5–7 year lifecycle. Network equipment similar. Cloud infrastructure may not have hardware lifecycle but services evolve and migrate.

Operating systems: OS vendors eventually end support. Windows versions, for example, have defined end-of-support dates. Must upgrade before support ends or face security risks.

Applications: Applications reach end-of-vendor-support. Or they no longer meet needs as requirements evolve. Replacement or major upgrades required periodically.

Your role as IT leader in lifecycle management

Maintain lifecycle visibility. Track lifecycles for all major technology assets. Know:

- When hardware is due for replacement
- When OS/application support ends
- What replacements are planned when
- What budget is required

Communicate early. Don't surprise customers with "Your system is being replaced next month." Communicate well in advance:

- "Your department's computers are reaching 4-year mark next year. We'll be planning replacements. Here's typical timeline and what to expect."
- "Microsoft ends support for Windows 10 in October 2025. We'll need to upgrade all Windows 10 machines before then to maintain security. Here's our plan."

Involve customers in replacement decisions. When replacing end-user technology, involve users:

- "We're refreshing laptops next year. We've identified three models that meet our standards. Which would you prefer?"
- "Current financial system reaches end-of-support in two years. We need to plan replacement. Let's form evaluation committee to select replacement."

Plan transitions carefully. Replacements are disruptive. Minimize disruption through:

- Careful timing (avoid busy seasons)
- Clear communication about what's changing and when
- Training and support during transition
- Parallel operation when feasible until users are comfortable

Justify lifecycle decisions. When customers ask "Why are we replacing this? It still works," explain:

- Security risks of unsupported systems
- Reliability issues with aging hardware
- Performance improvements from newer technology
- Cost of maintaining old versus cost of replacing

Transparency builds understanding and reduces resistance.

Creating a technology refresh program

Systematic lifecycle management is easier than ad hoc replacements:

Desktop/laptop refresh program: Replace on regular cycle (e.g., every 4 years). Users know when to expect new equipment. Budget is predictable.

Server refresh program: Similar approach for servers, replace on predictable cycle tied to warranty expiration.

Application lifecycle reviews: Annually review major applications:

- Is vendor support continuing?
- Does application still meet needs?
- Are there better alternatives?
- When should we plan replacement?

These programs let you manage equipment ahead of failure instead of reacting to crisis replacement.

Making It All Work Together

Services and Products excellence comes from a full-picture approach to making sure IT serves customer needs, not from any single practice in isolation.

The virtuous cycle:

1. Publish service catalog - Customers know what IT offers

2. Engage regularly to understand needs - IT knows what customers need

3. Involve customers in service selection - Services align with needs

4. Include customers in product evaluation - Products meet user requirements

5. Communicate lifecycle transparently - Transitions are planned and supported

6. Update service catalog - Cycle continues with improved services

Each element reinforces others. Service catalog reveals gaps. Customer engagement identifies needs. Governance enables decision-making. Product evaluation helps fit. Lifecycle management maintains currency.

Over time, this closes the gap between what IT provides and what customers actually need, not perfectly, but steadily.

Putting the Customer First

Services and Products excellence is about fundamental respect for customers. They're not passive recipients of IT services. They're partners in determining what services should be provided and how.

This requires mindset shift from "IT knows best" to "customers know their needs, IT provides expertise to meet those needs."

- It requires transparency through service catalogs so customers know what's available.
- It requires engagement to understand customer needs.
- It requires involving customers in selecting Services and Products.
- It requires transparent lifecycle management so transitions are planned, not surprising.

When this works, IT stops being seen as obstacle or ivory tower. You become a trusted partner in the organization's work, not just the team that keeps the lights on.

That's not just better for customers. It's better for IT. Being valued strategic partner is far more rewarding than being embattled service provider nobody appreciates.

The practices in this section create that partnership, service catalog, customer engagement, collaborative selection, transparent lifecycle management. Implement them systematically, and alignment follows.

How This Connects to the Broader Framework

Services and Products alignment connects throughout the approach:

Your Module 1 leadership development supports this:

- **Purpose clarity** (Section 1.1) keeps service decisions focused on what residents and departments actually need
- **Communication** (Section 1.5) is how you engage customers and translate technical trade-offs into business terms
- **Political navigation** (Section 1.4) helps balance competing customer demands

Module 2's culture and structure work prepares you:

- **Vision** (Section 2.2) should emphasize customer partnership
- **Culture** (Section 2.5) must value customer service and collaboration
- **Communications** (Section 2.6) carries service catalog and lifecycle information

Earlier in Module 3:

- **Governance** (Section 3.1) is the mechanism for customer-driven service decisions

- **Strategic planning** (Section 3.2) should reflect customer needs and priorities
- **Frameworks** (Section 3.3) should enable customer service, not create barriers

Later in Module 3:

- **Budget and economics** (Section 3.5) makes transparent the cost of services customers choose

Module 4: Delivering Great Service (future) will build on alignment by addressing how to deliver services effectively once they're aligned with customer needs.

Alignment is a prerequisite for excellence. You can't deliver excellent service if you're delivering the wrong services.

Key Takeaways

- Services and Products alignment requires mindset shift from IT as provider to IT as partner
- Service catalog creates transparency about what IT offers with clear descriptions and request processes
- Understanding customer needs requires regular, systematic engagement, not just reactive response to requests
- Customers should drive service selection decisions with IT providing technical expertise and guidance
- Product selection should include end-user participation through evaluation committees and hands-on testing
- Technology lifecycle management requires transparent communication about when/why replacements occur
- IT's role is advisor and facilitator, not unilateral decision-maker
- Balancing customer preferences with organizational constraints requires transparency about trade-offs
- Service directories should be customer-friendly, accessible, and regularly maintained
- The goal is progressive alignment over time, not perfect alignment immediately

Reflection Questions

Assess your Services and Products alignment:

1. Do you have a published service catalog that customers use? Can they easily find it?
2. Can customers clearly explain what IT does and how to request services?
3. How often do you meet with department leaders specifically to understand their needs and challenges?

4. When was the last time customers participated in selecting a service or product that affects them?
5. Do customers feel like partners in IT decisions, or passive recipients of IT's choices?
6. How do you communicate about technology lifecycles and planned replacements?
7. What percentage of your service portfolio was selected based on customer input versus IT deciding unilaterally?

The working documents for this section are in Appendix A.3.4.

Section 3.5

Budget and IT Economics

A CIO I know tells a story about the day that changed how he thought about IT budgets. His County Executive called him in during a budget crisis and asked a simple question: "Can you explain to me what we're getting for the $8.5 million we spend on IT?"

He froze. He could tell the executive what they spent money on: salaries, software licenses, hardware, maintenance contracts. He could show the project list, recite activities. But he couldn't clearly articulate the value. He couldn't explain why IT was worth $8.5 million in terms the County Executive cared about.

The County Executive didn't demand immediate cuts that day. But the question exposed a fundamental problem: this CIO was managing IT as a cost center, not as a value generator. He was tracking expenses, not showing outcomes. He was defending line items, not making strategic cases for investment.

That conversation sparked a two-year transformation. The team connected budget to strategy, created transparency about IT economics, and developed metrics that showed value, not just activity. Two years later, they had multi-year financial plans that leaders could actually understand and support.

The next time budget pressures came, that CIO could answer the question. He could show exactly what the organization was getting for its IT investment. And IT wasn't asked to make across-the-board cuts. Instead, they were asked to help other departments use technology more effectively to achieve their efficiency goals.

I've heard variations of this story from dozens of IT leaders. The specifics change, but the pattern is consistent: IT leaders who can't articulate value face perpetual budget battles. IT leaders who show value strategically become trusted partners in organizational resource allocation.

This section focuses on building IT budgets that are defensible, strategic, and transparent, budgets that show value and build confidence in IT leadership.

Why IT Budgets Are Different (And Difficult)

IT budgets are uniquely challenging in local government. Understanding why helps you address the challenges effectively.

IT is largely invisible to non-technical leaders. When you pave a road, people see the road. When you hire deputies, people see more patrol cars. When IT spends money, the results are often invisible, systems run better, disasters are prevented, work happens more efficiently. Value is real but hard to see.

IT costs are concentrated while benefits are distributed. IT budget appears as one large line item. But benefits accrue across the entire organization, better service in HR, faster permitting in Planning, more effective investigations in Sheriff's Office. This makes IT look expensive relative to visible benefit.

Technology changes rapidly. What you bought three years ago may need replacement today. This feels wasteful to decision-makers who think "We already bought computers. Why do we need new ones?" The rapid pace of technology obsolescence is foreign to most government operations.

IT serves everyone, which means IT satisfies no one fully. With limited budget, you can't give every department everything they want. Everyone sees what they didn't get more than what they did get.

IT investments are often infrastructure. Investments in infrastructure (networks, servers, security) don't deliver visible business functionality. They enable future capability, prevent problems, and create foundation. But they're hard to justify because benefits are indirect.

IT speaks a different language. When you talk about "virtualization," "infrastructure modernization," or "security posture," people hear expensive things they don't understand. Translation to business value is essential but often missing.

These challenges mean IT budgets face more scrutiny and skepticism than most department budgets. Your job as IT leader is making the budget defensible, not just managing it.

The Foundation: Connecting Budget to Strategy

The single most important principle of IT budgeting: **your budget must directly connect to organizational strategy and priorities.** IT budgets that don't clearly serve organizational mission are indefensible.

This connection flows through the strategic alignment framework you've built:

The strategic alignment cascade has five steps, each enabling the next:

1. Organizational strategy and priorities set direction, from the county or city strategic plan or executive priorities.

2. IT strategic plan aligns IT's direction with that organizational need.

3. IT governance prioritizes initiatives and services based on the strategic alignment.

4. IT budget allocates resources to the priorities established through governance.

5. Value demonstration shows how the budget delivered on the strategic priorities.

When budget pressures come (and they always come), this connection is your defense. "This budget implements the strategic priorities your governance council approved. Here's how each major investment advances organizational goals."

Without this connection, you're justifying line items. With it, you're showing strategic alignment. It's the difference between "cut 10%" and "help us understand the trade-offs."

How to create this connection:

Start strategic planning cycle before budget cycle. Your strategic plan should be updated annually before you build next year's budget. Strategy drives budget, not vice versa.

Use governance to prioritize initiatives. Your governance structure should review and prioritize initiatives quarterly. When budget time comes, you're funding what governance already prioritized.

Map budget to strategic goals. In your budget presentation, explicitly show how major investments map to strategic goals:

- "Strategic Goal 1: Improve Citizen Service - $1.2M investment in online services portal and payment system"
- "Strategic Goal 2: Strengthen Security - $800K investment in security operations center and endpoint protection"

Show organizational outcomes, not just IT outputs. Don't say "Upgrade network infrastructure - $500K." Say "Enable remote work and improve public WiFi access - $500K network infrastructure upgrade supporting organizational flexibility initiative."

This connection transforms budget from accounting exercise to strategic communication tool. Your budget should reflect and advance the vision you've articulated.

The Three-Legged Stool: Operating, Capital, and Projects

Effective IT budgets require three integrated components, like a three-legged stool, each is necessary for stability.

Leg 1: Operating Budget

This covers ongoing costs to keep IT running:

- Personnel (salaries, benefits)
- Software licenses and subscriptions (enterprise software, cloud services, security tools)

- Hardware maintenance and support contracts
- Telecommunications (phones, internet, WAN connectivity)
- Utilities for data center (if applicable)
- Professional services and consulting
- Training and professional development
- Supplies and miscellaneous expenses

Operating budget is your baseline, what it costs to maintain current state. This typically represents 60–75% of total IT budget in local government.

Common operating budget challenges:

Software licensing costs are growing. Shift from perpetual licenses to subscriptions means ongoing costs increase. Cloud services, SaaS applications, security tools, these are all recurring expenses that grow annually. This is a structural shift in IT economics that leaders need to understand.

Personnel costs increase annually. Salaries, benefits, and the challenge of retaining technical talent mean personnel costs typically grow 3–5% annually even without adding staff. Investing in people is ongoing operational cost.

"Hidden" costs surface. When you uncover previously untracked costs (shadow IT spending, decentralized purchases, compliance costs), operating budget needs increase without new services being added.

Your role with operating budget:

Maintain detailed cost tracking. Know exactly what you spend on software licenses, by vendor, by product. Track maintenance contracts and renewal dates. Understand telecommunications costs by circuit, by location. This visibility is essential for showing where money goes.

Identify optimization opportunities. Regularly review operating costs for savings opportunities:

- Licenses you're paying for but not using
- Maintenance contracts on equipment being replaced
- Redundant services or subscriptions
- Vendor consolidation opportunities

Forecast accurately. Operating costs are relatively predictable. Your forecast should be accurate within 2–3%. Significant variances (either over or under) damage credibility.

Communicate growth drivers. When operating budget increases, explain why: "Operating budget increased $300K due to: $150K cloud migration (approved strategic initiative shifting from capital to operating), $80K security tool subscriptions (addressing governance-identified risks), $70K staff salary increases per county policy."

Leg 2: Capital Budget

Capital budget covers major one-time investments typically with multi-year useful life:

- Hardware purchases (servers, storage, network equipment, end-user devices)
- Major infrastructure projects (data center upgrades, network buildouts)
- Facility improvements (cabling, environmental systems)
- Enterprise software purchases (large ERP systems, major platforms)

Capital typically represents 15–25% of total IT budget, though this varies significantly based on major refresh cycles and projects.

Capital budget planning requires multi-year view. You need to know:

- Equipment refresh cycles (desktops at year 4, servers at year 6, etc.)
- Major infrastructure coming due for replacement
- Planned major system implementations

This enables predictable capital requests rather than surprises. "Server refresh happens every 6 years. We're in year 5. Next year's budget includes server replacement" is defensible. "We need emergency server replacement because they failed" is not.

Transparent lifecycle planning makes capital budgets predictable and defensible.

Your role with capital budget:

Maintain asset lifecycle tracking. Know the age and replacement timeline for all major assets. Technology refresh programs provide this visibility.

Build multi-year capital forecast. Project capital needs 3–5 years out. This helps organizational financial planning and prevents surprises. Your strategic plan should include this multi-year capital forecast.

Prioritize capital investments. When capital budget is constrained, use governance to prioritize: "We have $500K capital available and $800K in identified needs. Governance prioritized these investments based on strategic alignment and risk."

Consider operating impact of capital. Capital investments often increase operating costs (maintenance, licensing, support). Show total cost of ownership, not just upfront capital cost. This transparency prevents future budget surprises.

Leg 3: Project Portfolio

Projects are major initiatives with defined scope, timeline, and deliverables:

- New system implementations
- Major upgrades or migrations
- Business process automation
- Digital transformation initiatives
- Infrastructure modernization programs

Projects typically represent 10–20% of budget but deliver most visible new capability.

Project portfolio connects directly to strategic plan and governance. Your strategic plan identifies strategic initiatives. Governance prioritizes them annually. Budget funds what governance prioritized.

Your role with project portfolio:

Maintain clear project pipeline. Track projects in three states:

- **Active:** Currently in progress, consuming resources
- **Approved:** Governance-approved, waiting for capacity or funding
- **Proposed:** Under consideration, not yet approved

Show capacity constraints realistically. Don't promise more projects than you can execute. "Our project capacity is 3–4 major initiatives simultaneously given current staffing. Here are projects in flight and when capacity becomes available."

You can only execute projects if you have capable people with available capacity.

Track project spending separately. Don't bury project costs in operating budget. Separate visibility enables accountability and shows project value.

Communicate project ROI. For major projects, show expected return: cost savings, efficiency gains, service improvements. Then report actual results after implementation.

Why all three legs matter:

Operating budget keeps lights on. Capital budget maintains and modernizes infrastructure. Projects deliver new capability. You need all three.

Organizations that only fund operating create technical debt, infrastructure ages, capability doesn't grow. Organizations that over-invest in projects while starving operating budget struggle with reliability and support. Organizations that neglect capital end up with crisis replacements.

Balanced investment across all three creates sustainable IT that maintains current capability while building for the future.

Building a Defensible Budget: The Process

Creating a defensible IT budget requires systematic process, not just filling out forms.

Step 1: Start Early (4–6 months before fiscal year)

Budget development should begin well before official budget season. This gives you time for:

- Strategic plan updates
- Governance priority-setting
- Stakeholder engagement about needs
- Multi-year financial forecasting
- Business case development for major initiatives

Starting early also signals to leadership that you're planning strategically, not scrambling reactively.

Step 2: Update Strategic Context

Before building budget, refresh your understanding of:

- Organizational strategic priorities (has anything changed?)
- Technology trends affecting local government
- Emerging risks or compliance requirements
- Customer needs and satisfaction
- Lessons learned from previous year

This context makes sure budget reflects current reality, not assumptions from last year.

Step 3: Baseline Your Current State

Build your baseline budget, what it costs to maintain current operations at current service levels:

- Current personnel costs with expected increases
- Current software licensing with known increases
- Maintenance contracts renewing
- Telecommunications at current levels
- Other ongoing costs

This baseline is your starting point. Everything else is a change from baseline that requires justification.

Step 4: Identify Required Changes

Some budget changes are required, not optional:

- Compliance mandates (new regulations requiring investment)
- End-of-life replacements (systems reaching end of support)
- Security requirements (addressing known vulnerabilities)
- Contractual obligations (committed multi-year projects)

These should be clearly distinguished from discretionary investments. Required changes have different justification threshold than strategic investments.

Step 5: Prioritize Strategic Investments

Use your governance structure to prioritize discretionary investments:

- Strategic initiatives from your strategic plan
- New capabilities customers requested
- Infrastructure improvements
- Capability building initiatives

Governance decides what makes the cut based on available budget and strategic alignment. This makes prioritization transparent and defensible.

Step 6: Develop Business Cases for Major Investments

For significant new investments, develop business cases that show:

- **Problem/opportunity:** What challenge does this address? What capability does it enable?
- **Strategic alignment:** How does this advance organizational priorities?
- **Alternatives considered:** What other options were evaluated? Why is this the best choice?
- **Costs:** Total cost of ownership (capital + ongoing operating impact)
- **Benefits:** Quantified where possible (cost savings, efficiency gains, risk reduction, service improvement)
- **Risks:** What are risks of proceeding? Of not proceeding?
- **Timeline:** When will investment occur? When will benefits be realized?

Business cases transform requests into strategic proposals that leaders can evaluate.

Step 7: Build Complete Budget Picture

Assemble all components:

- Baseline operating costs
- Required changes
- Prioritized strategic investments
- Capital refresh programs
- Project portfolio

Show how pieces fit together and how total budget maps to strategic goals.

Step 8: Create Compelling Presentation

Your budget presentation should tell a story, not just list numbers:

- Start with organizational context and priorities
- Show how IT budget advances those priorities
- Use visuals, charts showing budget by strategic goal, project timelines, cost trends
- Translate technical investments into business outcomes
- Be transparent about what's not funded and why (capacity constraints, prioritization)

The presentation is as important as the budget itself. Numbers without narrative don't persuade.

Step 9: Engage Decision-Makers Early

Don't surprise anyone with budget requests. Socialize major elements before official presentation:

- Preview with governance council
- Brief finance leadership
- Discuss with county executive or city manager
- Share with key department heads who benefit from proposed investments

Early engagement surfaces concerns you can address and builds support before formal approval process.

Step 10: Be Prepared to Defend

Anticipate questions and prepare answers:

- "Why did IT budget increase X%?"
- "Can't we delay this investment?"
- "What if we cut X%, what would we lose?"
- "How does this compare to peer organizations?"
- "What return are we getting on this investment?"

Having clear, confident answers shows you've thought through your budget strategically.

Making the Case: Justifying IT Investments

Even with solid process, you must make compelling cases for IT investments to non-technical decision-makers.

Start with organizational impact and strategic alignment, not technical solutions. Don't say "We need to upgrade our storage infrastructure to SAN with NVMe drives." Say "Storage constraints are slowing database performance and limiting our ability to provide responsive services to departments. This impacts permit processing, HR system responsiveness, and public safety records access. This investment directly supports the digital government priority that governance identified as our top strategic initiative." Lead with the problem in business terms, connect to documented strategic priorities, then introduce the technical solution as the means.

Quantify benefits where possible. Attach numbers whenever you can: "This reduces permit processing time from 45 minutes to 15 minutes, enabling 50% more permits processed per day." "This network upgrade eliminates 200 hours per year of staff time lost to connectivity issues." Some benefits are qualitative, that's fine, acknowledge them. But quantify what you can.

Frame infrastructure as an enabler. Infrastructure investments don't deliver visible business functionality, but they make all other capabilities possible. Frame them that way: "This network upgrade doesn't deliver new services by itself, but it enables remote work, online citizen services, and reliable public safety connectivity. Without it, those capabilities aren't possible."

Emphasize risk mitigation. For security and compliance investments, emphasize risk avoided: "Cybersecurity insurance requires these controls. Without them, we lose coverage." "This system reaches end of vendor support next year, creating security vulnerabilities." Risk avoidance is real value, even though it's harder to see than new capability.

Be honest about total costs. Don't lowball costs to get approval, then come back for more. Show total cost of ownership including upfront capital, implementation, ongoing operating costs, and hidden costs like integration and training. It's better to

be denied based on full cost than approved based on incomplete cost and then fail due to budget shortfalls.

Managing IT Budget Strategically

Once budget is approved, strategic management makes sure resources flow to priorities and value is visible.

Monthly financial review

Don't just look at budget once when building it and again at year-end. Monthly reviews enable:

- Early detection of variances (over or under budget)
- Course corrections before small issues become big problems
- Reallocation of resources from delayed projects to higher priorities
- Accurate forecasting of year-end position

Review with your leadership team. They need to understand financial position to make good decisions.

Track actual vs. budgeted by category

Monitor each major budget category:

- Personnel: on track? Any unfilled positions affecting budget?
- Software licensing: any unexpected increases? Optimization opportunities?
- Projects: are projects on budget? Any overruns or savings?
- Capital: is refresh schedule on track?

Category-level tracking reveals patterns that total budget view misses.

Manage projects to budget

Projects are most likely source of budget variance. Tight project financial management prevents this:

- Establish budgets for each project
- Track spending against project budgets monthly
- Require project managers to explain significant variances
- Halt projects approaching budget limits until issues resolved

Project budget discipline prevents small overruns from accumulating into major problems.

Build contingency into budget

Things go wrong. Unexpected costs arise. Smart budgets include contingency:

- 5–10% contingency for operating budget (handles unexpected equipment failures, unplanned consulting needs, emergency purchases)
- 10–15% contingency for projects (inevitable scope changes, integration challenges, vendor issues)

Contingency isn't "extra money to spend." It's insurance against uncertainty. At year-end, unexpended contingency can be returned or reallocated.

Reforecast regularly

Don't stick rigidly to original forecast when circumstances change:

- Project delays free up capacity and budget for other work
- Unexpected costs require adjustments
- Strategic priorities shift

Reforecast quarterly: "Based on current trajectory, here's updated projection of year-end position." This enables anticipatory management instead of year-end surprises.

Communicate financial position broadly

Share financial position with governance council quarterly:

- Budget vs. actual summary
- Major variances and explanations
- Project spending status
- Forecast year-end position

Transparency builds trust. Surprises at budget time next year destroy trust.

Make trade-offs visible

When budget constraints require trade-offs, make them visible:

- "We received requests totaling $2M but have $1.2M available. Here are options for how to allocate funding, with trade-offs for each approach."

This educates people about the reality of constraints and so trade-offs become explicit decisions, not just IT saying no.

Creating Cost Transparency: IT Economics for Stakeholders

Most people outside IT don't understand IT economics. They don't know what things cost, why costs are what they are, or how IT budget compares to similar organizations. This knowledge gap creates suspicion and unrealistic expectations.

Your role is creating transparency without creating full IT chargeback (which is complex and often counterproductive in local government).

Help leaders understand major cost drivers:

Personnel is largest cost (typically 40–60% of IT budget). Help them understand:

- How many IT staff you have
- What they do (not just "IT", specific roles and functions)
- How your staffing compares to similar organizations (e.g., "We have 1 IT staff per 35 employees, which is typical for counties our size")

- Why technical staff cost more than average county salaries (market rates for tech talent)

Software costs are growing rapidly. Explain the shift from perpetual licenses to subscriptions:

- "Five years ago, we paid $100K once for software. Now we pay $35K annually forever. This is industry-wide shift to subscription models."
- Show top 10 software costs so leaders understand where money goes
- Explain why you need multiple security tools, multiple platforms (can't just use "one antivirus")

Infrastructure makes everything else possible but is invisible. Help leaders understand:

- What infrastructure you have (servers, storage, networks, data center or cloud)
- What it does ("This infrastructure hosts 45 applications used by every department")
- Why it needs periodic replacement (technology lifecycle)
- How cloud is changing economics (shifting from capital to operating expense)

Projects require investment before benefits materialize. Manage expectations:

- "This project costs $800K over 18 months. Benefits begin accruing in month 12 and reach full value by month 24."
- Show timeline of investment and return visually

Consider service-based cost transparency (without formal chargeback):

Full IT chargeback, where departments are charged for IT services they consume, is complex and controversial. Many local governments attempt it and abandon it due to overhead and political challenges.

But you can provide transparency about service costs without formal chargeback:

Create cost profiles for common services (cost per desktop user, cost per laptop user, cost to provision a new employee) so departments understand the rough cost implications of their requests. Show total cost of ownership for major systems so leaders can evaluate whether proposed new investments are reasonable. For larger departments, provide budget allocation visibility so each department understands roughly what IT services cost them. And benchmark against peer organizations using resources like NASCIO surveys, Gartner research, and ICMA data. Context about whether your spending is reasonable relative to peers is one of the most powerful tools for budget conversations.

Be careful with benchmarks, no two organizations are identical. But directional comparison provides useful context.

Multi-Year Financial Planning

Annual budgets are necessary but insufficient. Strategic IT planning requires multi-year financial view.

Why multi-year planning matters:

Strategic initiatives span multiple years. Major system implementations, infrastructure modernization, organizational transformation, these take 2–5 years. You need financial visibility across full initiative lifecycle.

Capital needs are cyclical. Desktop refresh in year 3, server refresh in year 5, network upgrade in year 4. Multi-year view prevents surprises and enables predictable capital requests.

Operating costs have momentum. Decisions made today create ongoing costs for years. Cloud migration might cost $500K in year 1 but saves $200K annually years 2–5. Multi-year view captures full impact.

Confidence requires predictability. When leaders see multi-year financial plan, they trust you're thinking ahead, not just reacting year by year.

Building a 3–5 year financial forecast:

Start with strategic plan. Your strategic plan identifies major initiatives across 3–5 years. Each initiative has cost implications. Translate strategic roadmap into financial roadmap.

Layer in lifecycle-driven costs. Add known refresh cycles:

- Year 1: Desktop refresh cycle
- Year 3: Server refresh cycle
- Year 4: Storage replacement
- Year 5: Network core equipment refresh

Project operating budget growth. Operating costs don't stay flat:

- Personnel: 3–5% annual growth (salaries, benefits increases)
- Software: 5–8% annual growth (subscription inflation, scope growth)
- Infrastructure: variable based on major changes

Show multiple scenarios. Don't just show one forecast. Show:

- **Current trajectory:** What happens if we continue current state
- **Strategic scenario:** What happens if we fund strategic initiatives
- **Constrained scenario:** What happens if budget cuts required

Multiple scenarios help leaders understand implications of different funding levels.

Update annually. Multi-year forecast isn't static. Update it annually as part of strategic planning process. Each year, horizon extends forward, you're always looking 2–4 years ahead.

Communicate the multi-year view:

Share multi-year financial forecast with governance council and finance leadership. This:

- Helps organizational long-range financial planning
- Surfaces future budget needs early
- Shows IT is planning strategically
- Builds confidence in IT financial management

Don't surprise finance with major budget requests. When they've seen multi-year forecast showing "Year 3: Server refresh, $600K," the actual budget request in year 3 isn't a surprise, it's expected.

Demonstrating Value: Metrics and Outcomes

The final element of effective IT budgeting: showing value delivered. Budget justification is forward-looking ("here's what we'll do with resources"). Value demonstration is backward-looking ("here's what we delivered with resources invested").

Why value demonstration matters:

Builds credibility for future requests. When you consistently deliver on commitments, leaders trust future budget requests. When you fail to show value, future requests face skepticism.

Shows IT as investment, not just cost. IT spending can be seen as necessary evil (cost to minimize) or strategic investment (value to maximize). Value demonstration shifts perception toward investment.

Educates leaders about IT contributions. Most people don't see IT's daily work. Systematic value communication makes contributions visible.

Informs future prioritization. Tracking which investments delivered most value helps prioritize future investments.

What to measure and communicate:

Project outcomes (not just completion):

- "We completed 12 projects this year"
- "We completed 12 projects delivering: $400K in cost savings, 25% faster permit processing, online payments for 8 services enabling 2,500 citizen transactions, security improvements reducing vulnerability count by 60%"

Focus on outcomes, not outputs. Completion is output. Business value is outcome.

Service delivery performance:

- Uptime percentages for critical systems
- Incident response times vs. SLA targets
- User satisfaction scores

- Help desk resolution metrics (first-call resolution rate, average resolution time)

Show you're delivering reliable, responsive service.

Efficiency and productivity improvements:

- Process improvements that reduce time or cost
- Automation that eliminates manual effort
- Self-service capabilities that reduce help desk load

Quantify efficiency gains where possible.

Risk mitigation:

- Security incidents prevented (attempted attacks blocked)
- Successful disaster recovery tests
- Compliance audits passed
- Backup success rates

Risk mitigation is real value even though it's preventing negative outcomes rather than creating positive ones.

Strategic initiative progress:

- Status of strategic initiatives from strategic plan
- Milestones achieved
- Benefits realized vs. projected benefits

Show you're making progress on strategic agenda, not just maintaining status quo.

How to communicate value:

Annual IT accomplishments report. At end of fiscal year, produce report summarizing:

- Major projects completed and value delivered
- Service delivery performance
- Strategic initiative progress
- Operational highlights
- Key metrics and trends

Share with governance council, county executive, and broadly across organization. This becomes your "here's what IT did with your investment" communication.

Quarterly updates to governance. Don't wait until year-end. Provide quarterly updates on progress, metrics, and value delivered. This keeps IT contributions visible throughout the year.

Project-specific value reporting. After major project completion, produce brief report showing:

- What was delivered

- What it cost vs. budget
- Benefits being realized
- Lessons learned

This closes the loop on individual projects and shows accountability.

Integrate value communication into other channels. Include accomplishments in:

- IT newsletter or regular communications
- All-staff meetings
- Governance council meetings
- Budget presentations

Make value communication ongoing, not just annual event.

Use storytelling, not just statistics:

Numbers matter, but stories make value real:

- "We implemented online payments, which processed 2,500 transactions"
- "We launched online payment capability in June. Within 3 months, 2,500 citizens used it to pay permits, utility bills, and business licenses. We heard from citizens who appreciated not having to take time off work to come to county offices to pay in person. Planning department staff spend less time processing payments and more time on permit review."

Stories with human impact land harder than statistics alone.

Compare results to projections:

When you projected benefits during budget justification, report actual results:

- "Projected $200K savings from server consolidation. Actual savings: $185K"
- "Projected 30% improvement in permit processing time. Actual: 35%"
- "Projected 90% user satisfaction. Actual: 87%"

This accountability, showing you deliver what you promise, builds enormous credibility.

Common IT Budget Pitfalls

Surprising leaders with large requests. Presenting major budget items that leaders haven't seen before generates suspicion and resistance. Socialize major elements early and use multi-year forecasting so future needs are visible years in advance.

Using jargon instead of business language. Presenting budget in technical terms makes IT seem like a black box consuming resources for mysterious purposes. Translate everything to business value and organizational outcomes.

Failing to show alternatives and trade-offs. Presenting budget as "this is what we need" without showing what alternatives were considered or what's not

funded at different levels. Always show options: "Here's the full request, here's the constrained scenario, here are the trade-offs."

Inadequate financial tracking. Not tracking budget closely during the year, then discovering significant variances at year-end. Both overruns and underspending damage credibility. Monthly financial reviews with your leadership team enable early detection and correction.

Underestimating total cost of ownership. Requesting funding for upfront costs without accounting for ongoing operating impact. Projects get approved on incomplete cost pictures, then struggle from insufficient operating budget. Always show TCO: capital plus multi-year operating impact.

Not demonstrating value delivered. Focusing all communication on what you need without showing what you delivered with previous investments. Over time, people question whether IT delivers value. Consistently showing value through annual reports, quarterly updates, and project outcome reporting builds the credibility that protects your budget.

Emerging Trends in IT Economics

Several structural trends are reshaping IT budgets. Cloud is shifting costs from capital to operating. Total spending may not change dramatically, but the budget mix does as large upfront capital investments give way to ongoing subscription costs. Leaders need to understand this isn't increased spending; it's a different spending pattern.

Cybersecurity is consuming a larger budget share. Ten years ago, 5–8% of IT budget on security was typical. Today, 12–15% is common, with movement toward 15–20% recommended. This growth is structural, not optional. Build it into multi-year forecasts and use your NIST CSF assessment to justify investments based on risk management.

Software subscription inflation is outpacing general inflation, with SaaS vendors typically increasing prices 5–8% annually. As more of your portfolio shifts to subscriptions, this compounds and requires ongoing education with budget decision-makers.

FinOps and cloud cost management are becoming essential. As cloud spending grows, practices for monitoring usage, optimizing resources, and controlling costs become a necessary management discipline. Unmanaged cloud spending can spiral quickly.

These trends mean IT budgets will face continued structural pressure. Your job is helping leaders understand what's changing and what you're doing about it.

The Takeaway

IT budget is about demonstrating strategic value and building confidence in IT leadership. The money is just the mechanism.

It requires:

Connecting budget to strategy through governance and strategic planning
Building defensible budgets with three integrated components: operating, capital, projects
Making compelling cases that translate technical investments to business value
Managing strategically through monthly reviews, variance management, and transparent communication
Creating cost transparency so leaders understand IT economics
Planning multi-year so future needs are visible and predictable
Showing value through metrics, outcomes, and clear communication

When you do this well, budget season stops being annual battle. It becomes strategic conversation about how to invest organizational resources in technology that advances mission.

You move from defending line items to partnering on resource allocation. From being seen as a cost center to being seen as a strategic investment. From leaders questioning IT value to leaders advocating for IT funding.

That transformation doesn't happen through better accounting. It happens through strategic budget leadership, connecting resources to outcomes and showing value consistently.

The practices in this section create that transformation. Use them systematically, and your budget becomes a strategic tool for organizational alignment and value communication.

How This Connects to the Broader Framework

Every element of this framework has a cost dimension. Budget and IT economics make that visible:

The leadership skills from Module 1 are what make budget work effective:

- **Purpose** clarity (Section 1.1) ties every budget line back to organizational priorities
- **Communication** (Section 1.5) determines whether your budget story persuades or falls flat
- **Political navigation** (Section 1.4) is how you survive budget negotiations and keep stakeholder expectations realistic
- **Time prioritization** (Section 1.2) is what lets you do strategic budget work instead of just reacting to finance deadlines

Your Module 2 organizational health work supports this:

- **Vision** (Section 2.2) should be reflected in budget priorities
- **Capable people** (Section 2.4) enable effective budget management and project execution

- **Communications** (Section 2.6) carries budget information and value demonstration throughout organization

Earlier in Module 3:

- **Governance** (Section 3.1) prioritizes budget allocations and makes trade-off decisions
- **Strategic planning** (Section 3.2) translates into multi-year budget forecasts
- **Frameworks** (Section 3.3) guide investment decisions (e.g., NIST CSF justifies security spending)
- **Service alignment** (Section 3.4) makes sure budget serves customer needs

Modules 4 and 5: Excellent service costs money, and improvement requires investment. Aligning budget to priorities is what makes both possible.

Budget is where strategy meets reality. Without money behind your priorities, strategic plans are just documents. When budget aligns to strategy, plans actually happen.

Key Takeaways

- IT budget must connect directly to organizational strategy through governance and strategic planning
- Three-legged stool: operating (60–75%), capital (15–25%), and projects (10–20%) all require balanced investment
- Start budget process 4–6 months before fiscal year with strategic context and governance prioritization
- Justify investments in business value terms, not technical jargon, translate everything to organizational impact
- Manage budget strategically through monthly reviews, variance management, and transparent communication
- Create cost transparency without necessarily implementing formal chargeback, help leaders understand IT economics
- Multi-year financial forecasting (3–5 years) enables predictability and demonstrates strategic thinking
- Show value systematically through metrics, outcomes reporting, and storytelling
- Common pitfalls: surprising leaders, using jargon, inadequate TCO analysis, failing to demonstrate value delivered
- Emerging trends: cloud changing cost structure, security consuming larger share, subscription inflation, FinOps importance

Reflection Questions

Before concluding this module, assess your budget and financial management practices:

1. Can you clearly explain what organizational value your IT budget delivers in non-technical terms?
2. Does your budget explicitly connect to strategic goals and governance priorities?
3. Do you track operating, capital, and project spending separately with clear visibility?
4. How often do you review actual spending vs. budget? Can you explain variances?
5. Do leaders outside IT understand IT economics, what things cost and why?
6. Do you have multi-year financial forecast showing future capital and project needs?
7. How systematically do you demonstrate value delivered from IT investments?
8. When budget pressures arise, can you articulate specific trade-offs at different funding levels?

The working documents for this section are in Appendix A.3.5.

Module 3: Summary

Strategic Alignment: Connecting IT to Organizational Mission

I've seen talented CIOs build strong teams, develop real leadership capability, and create healthy organizational cultures, only to watch their departments stay stuck in reactive mode. They're putting out fires, responding to whoever asks loudest, and fighting budget battles year after year. The missing piece is almost always strategic alignment. Without it, IT operates in a vacuum. With it, IT becomes a trusted partner advancing organizational goals through technology.

Module 3 is about building the structures and practices that connect your IT operation to your organization's mission. Not through bureaucracy or paperwork, but through practical mechanisms that make alignment happen naturally.

The five sections of this module build a framework for strategic alignment:

Section 3.1: IT Governance established the decision-making structures that make sure IT investments align with organizational priorities. Governance isn't bureaucracy. It's the mechanism for transparent, collaborative decision-making that builds trust across the organization and so resources flow to the highest priorities, not the loudest voices.

Section 3.2: Strategic Planning provided the process for translating organizational strategy into IT direction, building multi-year plans that connect to mission, engage partners, balance competing demands, and create roadmaps that guide investment and effort.

Section 3.3: Frameworks and Standards addressed the core practices that create organizational maturity: NIST Cybersecurity Framework, ITSM processes, technology standards, data governance, and architecture principles. What matters most is implementing frameworks that add value without creating bureaucracy, right-sized for local government.

Section 3.4: Services and Products focused on making sure IT provides services customers need and involves customers in selecting products and technologies. The mindset shift from IT as provider to IT as partner, and the practical mechanisms for understanding needs, engaging customers in decisions, and managing technology lifecycles transparently.

Section 3.5: Budget and IT Economics addressed how to build defensible IT budgets that demonstrate value and build confidence: the three-legged stool of operating, capital, and project budgets; making compelling cases for IT investments; creating cost transparency; and demonstrating value systematically.

The Integration: How Strategic Alignment Works as a System

These five sections aren't separate practices. They're an integrated system:

Governance is the engine. Your IT Governance Council (or equivalent structure) makes the critical decisions: What are our strategic priorities? Which

initiatives should we fund? How do we balance competing demands? What services should IT provide?

Strategic Planning translates organizational strategy into IT direction. Your IT strategic plan documents priorities identified through governance, creates multi-year roadmaps, and guides resource allocation.

Frameworks and Standards provide the operational discipline. NIST CSF guides security investments. ITSM processes keep service delivery reliable. Technology standards create consistency. These frameworks enable effective execution of strategy.

Services and Products Alignment keeps IT focused on customer needs. Your service catalog creates transparency about what IT offers. Customer engagement reveals what's needed. Collaborative selection helps Services and Products fit actual needs, not just IT preferences.

Budget and IT Economics allocates resources to priorities. Your budget funds what governance prioritized and strategic planning identified. Cost transparency helps leaders understand IT economics. Value demonstration builds confidence for future investments.

When these elements work together:

- Strategy drives governance decisions
- Governance prioritizes initiatives and services
- Strategic plan documents the roadmap
- Frameworks guide implementation
- Services align with customer needs
- Budget funds priorities
- Value demonstration justifies continued investment
- The cycle repeats with continuous improvement

IT consistently delivers value aligned with organizational mission, building trust and credibility that enables future strategic work.

Common Challenges in Strategic Alignment

Strategic alignment work brings predictable challenges:

Challenge 1: Governance feels like meetings without decisions

When governance becomes update sessions rather than decision-making forums, value disappears. Combat this by:

- Bringing real decisions to governance (not just updates)
- Preparing decision papers with clear options and recommendations
- Getting the right decision-makers to the table
- Following up on decisions to show they matter

Challenge 2: Strategic plans sit on shelves

Strategic plans fail when they're not connected to actual work and resource allocation. Prevent this by:

- Reviewing strategic plan progress quarterly in governance
- Explicitly connecting budget to strategic plan
- Using strategic plan to prioritize initiatives and defend trade-offs
- Updating plan annually based on progress and changing priorities

Challenge 3: Frameworks become bureaucracy

When frameworks create process overhead without value, people find workarounds. Avoid this by:

- Right-sizing frameworks for your organization
- Focusing on outcomes, not process compliance
- Getting feedback and adjusting based on experience
- Making frameworks enable work, not slow it down

Challenge 4: Customers don't engage in selection processes

When customers don't participate in service/product selection, alignment suffers. Encourage engagement by:

- Making participation worth their time (real input, not token involvement)
- Keeping evaluation processes efficient and focused
- Showing how their input influenced decisions
- Building trust over time through consistent inclusion

Challenge 5: Budget battles every year

When you can't defend IT budget, every budget cycle becomes battle. Build defensibility by:

- Connecting budget explicitly to strategic priorities
- Demonstrating value delivered from previous investments
- Creating multi-year financial forecasts
- Educating leaders about IT economics
- Being transparent about trade-offs when budget is constrained

Challenge 6: Alignment work feels disconnected from daily operations

When strategic alignment feels separate from daily work, it loses relevance. Integrate it by:

- Using governance to make operational decisions, not just strategic ones
- Connecting service delivery metrics to strategic objectives
- Including frontline staff perspectives in strategic planning
- Showing how frameworks improve daily work

Critical Success Factors

Strategic alignment succeeds when you:

1. Start with governance. Don't try to build strategic alignment without governance structure. Governance is the starting point, start there, even if simple.

2. Connect everything to organizational mission. Every IT initiative, service, and investment should connect to organizational strategy. Make these connections explicit and visible.

3. Build incrementally. Don't try to implement perfect governance, full strategic plans, and all frameworks simultaneously. Start simple, demonstrate value, build credibility, then expand.

4. Engage partners consistently. Strategic alignment requires ongoing stakeholder engagement, not one-time exercises. Build regular touchpoints into governance, planning, and service management.

5. Be transparent about constraints. Budget limitations, capacity constraints, competing priorities, be honest about these. Transparency builds trust even when you can't provide everything people want.

6. Demonstrate value systematically. Don't assume leaders see IT's value. Systematically communicate outcomes, metrics, and impact through governance updates, annual reports, and regular communications.

7. Adjust based on experience. Strategic alignment practices should evolve. What works in year one may need refinement in year two. Get feedback, learn, adapt.

8. Lead by example. If you expect others to follow governance decisions, honor them yourself. If you want frameworks followed, follow them. If you want transparency, be transparent. Leadership sets the tone.

How Module 3 Connects to Modules 1 and 2

Strategic alignment builds on the work from Modules 1 and 2:

Module 1: Being a Government IT Leader provides the personal leadership capabilities needed for strategic alignment:

- **Purpose clarity** (1.1) makes sure IT strategy serves organizational mission
- **Time prioritization** (1.2) creates space for strategic work
- **Delegation** (1.3) enables you to enable others in governance and planning
- **Political navigation** (1.4) helps manage stakeholder dynamics in governance
- **Communication** (1.5) is essential for strategy articulation and stakeholder engagement

Without Module 1 competencies, strategic alignment work becomes overwhelming or ineffective.

Module 2: Building a Healthy Organization creates the organizational conditions for strategic alignment:

- **Leadership team** (2.1) participates in governance and executes strategy

- **Vision** (2.2) connects to strategic plan and guides priorities
- **Structure and roles** (2.3) clarifies who does strategic alignment work
- **Capable people** (2.4) enables strategy execution
- **Healthy culture** (2.5) determines whether frameworks and governance are embraced or resisted
- **Communications** (2.6) carries strategic messages and builds understanding

Without Module 2's organizational health, strategic alignment has nothing to build on.

Your leadership skills and healthy organization start producing visible results here, where IT begins connecting to mission in ways people can actually see.

Preparing for Module 4: Delivering Great Service

With strategic alignment in place, the next challenge is delivering excellent service. Module 4 (coming next) will address:

- Delivering consistent, reliable IT services
- Effective project management that delivers on commitments
- Managing vendor relationships strategically
- Building service management capability
- Creating customer-focused service culture

Strategic alignment tells you WHAT to do (which services to provide, which initiatives to pursue, where to invest). Service excellence addresses HOW to do it effectively.

The work you've done in Module 3 prepares you for service excellence. Governance provides decision-making for service investments. Strategic planning identifies service priorities. Frameworks guide service delivery. Service alignment makes sure services meet customer needs. Budget funds service delivery.

What comes next is executing these services with excellence.

Final Thoughts

Strategic alignment doesn't mean more process or bureaucracy. The point is making sure IT serves organizational mission.

When IT lacks strategic alignment:

- Resources flow to whoever asks loudest, not highest priorities
- IT appears disconnected from organizational goals
- IT budget conversations become defensive rather than strategic
- Departments work around IT instead of through it
- Frameworks feel like obstacles rather than enablers
- Annual planning feels disconnected from what came before

When IT has strong strategic alignment:

- Resources flow to strategic priorities through governance
- IT is recognized as mission enabler

- Budget requests are defended through demonstrated value
- Services meet customer needs because customers helped define them
- Frameworks enable consistent, reliable delivery
- Each year builds on previous progress

The work of strategic alignment, governance, planning, frameworks, service alignment, budget management, creates this transformation.

It takes time, consistent effort, and stakeholder engagement. But it's the work that moves IT from reactive support function to strategic partner advancing organizational mission.

That's work worth doing.

The working documents for this module are in Appendix A.3.M.

MODULE 4

DELIVERING GREAT SERVICE

Introduction to Module 4

A colleague of mine was puzzled. Her department had just completed its annual customer satisfaction survey, and the results were disappointing. IT scored well on technical competence, systems were stable, response times were good, projects were delivered on schedule. But when asked if departments felt IT was a "valued partner," scores were mediocre at best.

During a follow-up discussion, a department head offered this feedback: "Your team knows technology inside and out. But here's what they don't seem to understand, we don't care about the technology. We care about what the technology enables us to do. When we ask for help, you explain what you did to fix it. We want to know how this helps us serve our residents better."

This disconnect is more common than most IT leaders realize. Technical excellence is necessary but insufficient for service excellence. You can have perfectly

functioning systems, efficient processes, and competent staff and still be seen as an obstacle rather than enabler.

Service excellence isn't primarily about technical execution. It's about enabling others to succeed at their mission.

This is especially critical in local government, where IT doesn't serve external customers directly, we enable other departments to serve citizens. When the Building Department issues permits, when Public Safety responds to emergencies, when Parks schedules activities, when Finance processes payments, IT is invisible but essential. Our service quality directly affects their ability to serve the public.

Yet many IT departments focus inward, on technical operations, system reliability, project delivery, rather than outward on how they enable mission success. This inward focus creates the disconnect that the frustrated CIO experienced.

Why Service Excellence Is Different from Technical Excellence

The CIO role contains an inherent tension: You lead a technical organization that exists to serve non-technical purposes.

This tension shows up in how IT is perceived:

- **Technical lens:** "IT keeps systems running and delivers projects."
- **Service lens:** "IT enables us to accomplish our mission more effectively."

The technical lens measures uptime, response times, project completion rates. The service lens measures business outcomes, user satisfaction, strategic value delivered.

Both matter. But when there's conflict between them, when technical perfection requires complexity that hinders business use, when security controls create friction that reduces productivity, when standard procedures prevent flexible response to business needs, which wins?

Organizations struggling with IT relationships typically have IT departments optimized for technical excellence at the expense of service excellence. Systems are secure but hard to use. Processes are rigorous but slow. Standards are comprehensive but inflexible. IT is doing everything "right" from a technical perspective while frustrating everyone from a service perspective.

The breakthrough comes when you recognize that **service excellence emerges from a different orientation than technical excellence.**

Technical excellence asks: "What do these systems need?" Service excellence asks: "What do our customers need to accomplish?"

Technical excellence optimizes: system stability, security, efficiency, standardization Service excellence optimizes: business outcomes, user satisfaction, mission enablement, value delivery

This isn't about abandoning technical discipline, you need secure, stable, well-managed systems. It's about subordinating technical considerations to service goals. Technology exists to serve mission, not the other way around.

The Service Excellence Paradox

Early in my career, I inherited an IT team with terrible customer satisfaction scores. My instinct was to attack the problem head-on, so I rolled out service standards, required customer service training, and started tracking resolution times. Six months later, the scores were worse.

A mentor finally told me what I didn't want to hear: "Your people aren't rude because they lack training. They're burned out because you haven't fixed the things that make their jobs miserable."

He was right. The real issues were upstream: unclear priorities pulling staff in five directions, no governance to stop drive-by projects, outdated tools that made simple tasks painful. Once I started fixing those structural problems, service improved without a single new training session.

That experience shaped how this entire framework is sequenced. Module 4 isn't where you fix service. It's where you learn to recognize that the work you did in Modules 1 through 3 is what makes great service possible.

Module 4 comes after Modules 1, 2, and 3 for a reason: by necessity, not accident.

How Modules 1–3 Enable Service Excellence

Service excellence isn't built directly. It's the output when other elements work well together.

Module 1 gave you the leadership credibility, the political skills, the ability to communicate with executives and elected officials in terms they understand. Without that, every service initiative becomes an internal IT project that nobody outside your team cares about.

Module 2 built the organizational health, the culture, the trust, the psychological safety that lets staff take ownership of customer interactions instead of hiding behind procedures. You cannot create genuine service orientation in a toxic culture. People who feel unsupported and undervalued don't suddenly start treating customers well because you told them to.

Module 3 aligned your strategy, making sure you're working on the right priorities, managing resources effectively, and connecting IT investments to organizational outcomes. Service excellence directed at the wrong priorities wastes everyone's time.

The frameworks and practices in Module 4 assume you've built these foundations. Without them, Module 4 becomes an impossible task. With them, it becomes the natural next step.

What Module 4 Covers

Module 4 provides the specific practices and frameworks that translate your healthy, well-aligned organization into consistently excellent service delivery.

Section 4.1: Policies and Procedures addresses the policy paradox, organizations need policies for consistency and compliance, but too many policies or the wrong policies destroy service quality by constraining staff's ability to respond to customer needs. You'll learn how to create policies that enable service rather than obstruct it.

Section 4.2: Portfolio and Service Management covers how to understand, organize, and actively manage everything IT provides as an interconnected portfolio. When you don't know what you're managing or lack clear service definitions, service quality inevitably suffers. This section shows how to bring strategic discipline to service delivery.

Section 4.3: Knowledge and Domain Management addresses how organizations capture, organize, and share knowledge while building domain expertise. Service excellence requires staff who can solve problems immediately rather than constantly escalating or researching. This section shows how to build and sustain organizational capability.

Section 4.4: Customer Service focuses on creating the culture, metrics, and trust that enable consistently excellent service. Not scripts and procedures, it's about creating conditions where employees are engaged, equipped, and trusted to do what's right for customers.

Section 4.5: Business Relationship Management shows how IT moves from order-taker to strategic partner. Great service delivery requires strong business relationships. This section addresses how IT leaders build and maintain strategic partnerships with business partners.

These five sections work together:

Policies and procedures (4.1) create the framework for consistent service. Portfolio and service management (4.2) ensures you're managing the right services well. Knowledge and domain management (4.3) gives staff the capability to deliver service effectively. Customer service excellence (4.4) creates the culture and trust that enables great service. Business relationship management (4.5) helps service efforts focus on what customers value.

The Service Excellence Mindset

Before diving into the sections, let's establish the mindset shift required for service excellence.

Old Mindset: IT as Technical Function

- Primary goal: Keep systems running reliably
- Success measured by: Uptime, response times, project delivery
- Customer interactions: Respond to tickets and requests
- Relationship with business: Provider responds to consumer requests
- Staff focus: Technical problem-solving
- Decision-making: Based on technical best practices

New Mindset: IT as Service Organization

- Primary goal: Enable organizational mission success
- Success measured by: Business outcomes, stakeholder satisfaction, value delivered
- Customer interactions: Active partnership and problem-solving
- Relationship with business: Strategic partners working toward shared goals
- Staff focus: Understanding and solving business problems through technology
- Decision-making: Based on business value balanced with technical considerations

This shift is subtle but significant. It changes:

- What you prioritize
- How you communicate
- What you measure
- How you hire and develop people
- What you celebrate and recognize
- How you make decisions

An IT department operating from technical mindset might:

- Implement multi-factor authentication that materially improves security but frustrates users and reduces productivity
- Standardize on a technology platform because it's technically superior, even though it doesn't integrate well with business systems
- Reject a department's request because "we don't support that" rather than exploring alternatives
- Measure success by how many tickets were closed rather than how well business needs were met
- Focus governance discussions on technical architecture rather than business value

An IT department operating from service mindset would:

- Implement multi-factor authentication in the most user-friendly way possible, accepting some technical compromise for better user experience
- Choose technology based on business integration and user experience as much as technical capability
- Respond to requests with "let's discuss what you're trying to accomplish and find the best solution"
- Measure success by business outcomes enabled and stakeholder satisfaction
- Focus governance discussions on whether IT is advancing organizational mission

Both care about technical excellence. But the service-oriented organization subordinates technical considerations to mission enablement.

What Success Looks Like

How do you know when you've achieved service excellence? Here are the indicators:

Stakeholder Perspective:

- Departments involve IT early in planning, not just implementation
- Business leaders advocate for IT budget and defend IT needs
- Stakeholders speak positively about IT value to elected officials and executives
- When problems occur, stakeholders work with IT to solve them rather than blaming IT
- Departments ask "what should we be thinking about?" not just "can you do this?"

Employee Perspective:

- IT staff understand how their work enables organizational mission
- Team members take pride in service quality, not just technical excellence
- Staff are trusted to make customer-focused decisions
- Employee engagement scores are high
- Staff retention is strong, people want to work in your department

Operational Perspective:

- Fewer emergency "we need this yesterday" requests; more strategic projects with adequate planning
- Clear service definitions with measurable quality targets
- Transparent metrics showing service performance
- Regular feedback from stakeholders used to improve service
- Continuous improvement is embedded in how the organization operates

Leadership Perspective:

- IT is seen as a strategic partner, not just a technical function
- You're invited to strategic planning discussions early
- Executive leadership understands and articulates IT value
- IT governance is genuine collaboration, not rubber-stamping
- Organizational strategy includes technology as enabler, not afterthought

These aren't abstract aspirations, they're tangible, observable indicators you can track over time.

How to Use This Module

Each section in Module 4 builds on the others, but you can start wherever your greatest need exists:

If your biggest challenge is:

- Policies that obstruct service → Start with Section 4.1
- Unclear service definitions and priorities → Start with Section 4.2
- Staff who lack expertise to solve problems → Start with Section 4.3
- Culture where service isn't valued → Start with Section 4.4
- Being seen as order-taker rather than partner → Start with Section 4.5

However, for service excellence, you'll need to address all five areas. They're interconnected:

- Great customer service requires clear service definitions (4.2) and enabling policies (4.1)
- Service management requires knowledge to deliver consistently (4.3)
- Business relationships require service excellence to be meaningful (4.4)
- Everything requires policies that enable rather than constrain (4.1)

Work through the sections systematically, but expect iterations. As you improve service management, you'll discover policy gaps. As you improve customer service, you'll identify knowledge gaps. As you build business relationships, you'll refine service definitions. This is natural and expected.

Final Thoughts Before You Begin

Service excellence is achievable in local government IT. Not easy, it requires ongoing effort, cultural change, and leadership commitment. But achievable.

The framework provided in this module isn't theoretical. It's distilled from decades of experience in local government IT, research on what works, and observation of organizations that successfully transformed from technically competent to strategically valued.

Your path toward service excellence won't follow a straight line. You'll face resistance, from staff who prefer technical focus, from people who've learned to expect less, from budget constraints that make investment hard, from organizational inertia that resists change.

What makes the effort worthwhile: **When IT delivers great service, political capital, budget support, and talent retention all improve.**

Business relationships improve and budget advocacy gets easier. Recruitment picks up because people want to work in service-oriented organizations. Staff take pride in enabling mission success. Governance becomes genuinely collaborative because people trust IT to deliver.

Service excellence creates a virtuous cycle that makes your job as IT leader more rewarding and your organization more effective at serving the public.

The work begins in the pages that follow. The five sections provide the frameworks, practices, and guidance you need. But frameworks don't create service excellence, leaders do, by building organizations where service excellence can flourish.

You've done the hard work in Modules 1–3. Now it's time to deliver on that groundwork by creating consistently excellent service.

Let's begin.

Section 4.1

Policies and Procedures

I once visited an IT department drowning in policies. There were policies for everything, detailed procedures for every conceivable situation, approval requirements for the smallest decisions, documentation mandates that consumed more time than the actual work.

The irony? Despite all these policies, service was inconsistent. Staff followed the policies they remembered and ignored the rest. Customers complained about rigidity and slow responses. And the IT team felt micromanaged and untrusted.

One of the senior technicians summed it up perfectly: "We spend more time documenting what we're going to do and why we did it than doing it. And half the time, the policy doesn't even fit the situation we're dealing with."

This CIO realized the problem wasn't just too many policies, it was that leadership was trying to write them all. Policies were being created for situations leadership didn't fully understand because they weren't doing the actual work anymore. And the policies prescribed solutions instead of establishing principles.

The real issue was even deeper: when you have too many policies, you effectively have no policies. Staff can't remember them all. They don't know which ones are current. They can't find them when needed. So they either follow the ones they remember (creating inconsistency) or they improvise (making policies irrelevant).

Organizational behavior experts have documented this pattern. An excessive amount of rules communicates distrust, crushes morale, treats employees like children, and can result in your best people looking for the first opportunity to exit. Worse still, the thicker an employee manual, the more likely every employee and manager is out of compliance.

What follows is a toxic culture pattern that destroys service excellence: Leadership sees staff not following policies, so they create more detailed policies with compliance requirements. Staff see more bureaucracy, so they find more workarounds. Trust erodes on both sides. Service suffers.

That realization led to a fundamental rethinking of leadership's role with policies and procedures. The question shifted from "How do we control what staff do?" to "How do we enable staff to make good decisions and deliver great service?"

The Policy Paradox

As an IT leader, you face a paradox with policies and procedures:

Without them: Inconsistency, poor decisions, security risks, compliance failures, knowledge loss when people leave, inability to scale, and chaos when problems arise.

With too many or wrong ones: Rigidity, slow response, staff frustration, workarounds that undermine policies, focus on compliance over outcomes, inability to adapt to situations, and terrible customer service.

The deeper paradox: Policy proliferation defeats its own purpose. When staff are drowning in policies, they effectively have no policies, unable to keep track of what's current, unsure to find what they need when they need it.

Generally speaking, the fewer barriers there are to compliance, the easier it will be for workers to follow the rules. Alongside lack of (or hard to access) information, unclear processes are a major culprit when it comes to non-compliance.

What happens? Staff either follow the policies they happen to remember, creating inconsistency, or they give up and improvise, making all policies irrelevant.

That isn't a compliance problem. It's a culture problem. And it directly undermines service excellence.

Think about it: unhappy, frustrated employees who feel micromanaged and untrusted do not deliver excellent customer service. When your staff spend more time worrying about following the right procedure than solving customer problems, service suffers. When they're afraid to use judgment because "that's not in the policy," you've created a compliance culture that kills service excellence.

Your role as leader is creating the policy environment that enables service excellence. Not writing every policy yourself. Not micromanaging enforcement. But establishing the approach, philosophy, and culture around policies that frees your team to serve customers effectively while maintaining necessary consistency and compliance.

Your Role as Leader: Creating the Framework

Your job isn't writing policies. Your job is creating the framework and environment where effective policies can emerge, be maintained, and enable great service.

This approach has several components that only you as leader can establish:

1. Establish the Policy Philosophy and Principles

Before anyone writes a single policy, you must establish the guiding principles that shape how your organization thinks about policies.

Leading companies have demonstrated the power of principle-driven policy simplification. Companies such as Eli Lilly and Company, General Electric, and European multinationals have invested in simplification, reversing decades of policy proliferation, jargon, and complexity by simplifying their policies and procedures. Their approach was radical, far-reaching, values-driven, and employee and business-focused.

Principle 1: Policies enable service, they don't prevent it. Every policy should make it easier for staff to serve customers well. If a policy makes service harder, it's the wrong policy. This is your litmus test.

Principle 2: Policies provide guardrails, not handcuffs. Policies define boundaries within which staff have freedom to make good decisions. They're not step-by-step instructions that eliminate judgment. Good policies tell staff what they need to accomplish and what constraints exist, then trust them to figure out how.

Principle 3: Fewer, better policies beat many poor ones. Quality over quantity. Consolidation over proliferation. It's better to have one complete policy that staff know and follow than five fragmentary policies that nobody can track. When in doubt, consolidate.

Principle 4: Policies reflect our values and reinforce healthy culture.

Every policy should align with and reinforce the cultural values. Policies that contradict your stated values destroy culture faster than anything else. If your values say "we trust our people" but your policies say "we don't trust you to make any decisions," culture suffers and service excellence becomes impossible.

Principle 5: Policies are living documents, not monuments. Policies must evolve as circumstances, technology, and needs change. Outdated policies are worse than no policies because they teach staff that policies are irrelevant. Regular review and updates are essential.

Principle 6: People closest to the work create the policies. You don't write policies for work you don't do. The people doing the work understand what guidance is needed and what enables good outcomes. Your job is trusting them to create effective policies, not dictating policies from your office.

These principles become your filter. When reviewing any policy, you ask: "Does this enable service? Does it provide guardrails without handcuffs? Is it necessary or should it be consolidated? Does it reflect our values? Is it current? Was it created by people who do this work?"

Communicate these principles clearly and repeatedly. Reference them in governance discussions. Use them to challenge proposed policies. Make them part of how your organization thinks about policies.

2. Define the Policy Taxonomy

Not everything needs to be a policy. Not everything requires the same level of detail or formality. Create clear definitions and criteria for different types of documents. This taxonomy helps everyone understand what level of guidance is appropriate for different situations.

People often use the word "policy" for everything. But "policy" actually means something specific. It should only describe the rules or goals of the company.

Policies: High-level principles and requirements that apply broadly across the organization. They answer "What must we do and why?" but generally not "How exactly do we do it step by step?"

Policies establish boundaries and requirements while leaving room for judgment. They're relatively stable, changing only when fundamental approaches or compliance requirements change.

Example: "All access to IT systems must be authenticated and authorized based on documented business need. Access follows the principle of least privilege, users receive only the access required for their role. Access is reviewed quarterly and removed promptly when no longer needed."

This policy establishes what must happen (authentication, authorization, least privilege, review) and why (security and compliance). It doesn't dictate the specific technical mechanisms or step-by-step procedures. It gives security staff clear requirements but trusts them to implement appropriately for different systems and situations.

Standards: Specific technical or operational requirements that ensure consistency and interoperability. They answer "What specific approach, technology, or configuration do we use?"

Standards are more detailed than policies but still focused on "what" rather than step-by-step "how." They change more frequently than policies as technology evolves.

Example: "All laptops deployed to staff must run Windows 11 Enterprise edition with full-disk encryption enabled. Laptops must meet our endpoint security baseline configuration including current antivirus, firewall enabled, and automatic updates configured. Approved laptop models are Dell Latitude 5440 or Dell Latitude 7440."

This standard specifies what technology and configuration is required. It makes sure consistency across the organization. But it doesn't tell the technician step-by-step how to configure each setting, it trusts them to implement the standard appropriately.

Procedures: Step-by-step instructions for specific, repeatable tasks. They answer "How exactly do we perform this task to achieve consistent, correct results?"

Procedures are the most detailed documents. They're appropriate for:

- Tasks performed infrequently where step-by-step guidance prevents errors
- Complex tasks with multiple steps where consistency is critical
- Tasks with compliance requirements requiring specific steps

- Onboarding new staff who need detailed guidance

Example: "Procedure for Provisioning New User Account" would detail the specific steps and systems involved in creating accounts with appropriate access.

Your leadership perspective on procedures: Procedures are valuable but should be used sparingly. They're maintenance-intensive and can become outdated quickly. Experienced staff often don't need them. Your role is making sure procedures exist for tasks where consistency actually matters, not documenting every possible task.

Guidelines/Recommendations: Best practices and recommendations that aren't mandatory but represent proven approaches. They answer "What's generally the best way to handle this?"

Guidelines provide guidance while explicitly allowing deviation when situations warrant. They're appropriate for situations where there are multiple valid approaches and professional judgment is needed.

Example: Incident documentation guidelines might recommend documenting troubleshooting steps as you work, while acknowledging that time-critical situations may require resolution first, documentation second.

Your leadership role: Guidelines represent organizational learning without imposing rigid requirements. They're ideal for capturing "what works well" while respecting professional judgment. Encourage your teams to develop guidelines that share knowledge without creating bureaucracy.

How to decide what needs what:

Ask these questions:

- **Is this a hard requirement** (compliance, security, legal)?

Policy or Standard

- **Does consistency matter more than flexibility** for this task?

Procedure

- **Do we need to document the "best way" but allow judgment**?

Guideline

- **Can experienced staff figure this out without documentation**?

Maybe nothing needed

The default should be less documentation, not more. Only create formal policies, standards, and procedures when there's clear value. Trust your staff's professional judgment for everything else.

3. Establish the Governance Structure

Someone needs to decide what policies are needed, who creates them, who approves them, and who maintains them. This is governance, but governance focused on enabling staff, not controlling them.

Policy ownership and creation:

Policies should be created by the people closest to the work. This puts expertise to work and creates policies that hold up in practice.

Your strategic responsibility: Establishing policy ownership is a governance decision. You're defining who has authority to create organizational requirements in different domains. This authority should match accountability, those creating policies must own the outcomes those policies produce.

How policy ownership works:

Policy ownership should align with your organizational structure. Functional area leaders identify policy needs and assign creation to appropriate staff. The pattern is simple: people who do the work create policies for that work.

Examples of ownership alignment:

- Security policies: Security team leadership
- Service desk procedures: Service desk supervisor or senior technicians
- Infrastructure standards: Infrastructure team lead or senior engineers
- Application development guidelines: Development manager or senior developers

Critical leadership principle: When someone creates a policy, they're accountable for its effectiveness. If a policy creates problems, the policy owner must fix it. This accountability keeps policies practical and valuable rather than theoretical mandates that don't work in practice.

Your role as leader:

You don't create the policies. But you:

- **Establish the framework** (the taxonomy, principles, and governance structure)
- **Approve policies** that cross organizational boundaries or have significant impact
- **Challenge policies** that don't align with principles (too prescriptive, too many, contradicting values)
- **Remove obstacles** so policy owners can create effective policies
- **Provide resources** (the content management system, time, training)

Policy review and approval:

Governance meets policy management here. Not every policy needs CIO approval, that would create bottlenecks and undermine the principle of trusting policy owners. But some policies have organizational implications requiring senior review.

Your governance decision: Define what level of policy requires what level of approval. This should match impact and scope:

Tier 1 - Team/Unit Level: Procedures and guidelines specific to a team. Approved by team supervisor. Examples: Specific troubleshooting procedures for common issues, guidelines for ticket categorization.

Tier 2 - Department Level: Standards and policies affecting multiple teams within IT. Approved by IT leadership team collectively. Examples: Naming conventions, access management procedures, change management process.

Tier 3 - Enterprise Level: Policies affecting the entire organization or with significant risk/compliance implications. Approved by CIO or IT Governance Council. Examples: Information security policy, acceptable use policy, data retention policy.

This tiered approach frees teams to create necessary guidance without bottlenecking everything through you. It also helps appropriate oversight for high-impact policies.

Policy review cycle:

Living documents require regular review. Establish the discipline:

Annual full review: Every policy reviewed at least annually by its owner. Is it current? Does it still serve its purpose? Should it be updated, consolidated, or retired?

Triggered review: Policies reviewed when circumstances change significantly, major technology changes, regulatory changes, incidents that reveal policy gaps, reorganizations.

Your leadership role: Create the expectation and accountability for regular review. Include policy currency in performance discussions with leaders. Celebrate when teams keep policies current. Address it when policies grow stale.

But don't create bureaucracy around review. The goal is current, relevant policies, not checking boxes on review schedules.

4. Provide the Infrastructure

Staff can't maintain living documents effectively without proper infrastructure. Your job as leader is making sure they have the tools they need.

At minimum, your policy system needs five things. A centralized repository, not policies scattered across file shares. Version control. Search and discovery. Accessibility from wherever staff actually work. Clear currency indicators showing when each policy was last reviewed. You don't need expensive specialized software. A well-organized SharePoint site with document libraries and workflows is often sufficient. Start simple, prove value, and evolve the system as needs grow.

The "Less is More" Philosophy

One of the most important principles deserves its own discussion: fewer, better policies beat many poor ones.

Why less is more:

Human memory is limited. Staff can internalize and follow maybe 10–15 key policies. Beyond that, they're looking things up constantly (if they bother to look them up at all).

More policies = less compliance. When staff are overwhelmed by policies, they stop trying to follow them. They either follow the ones they remember (inconsistency) or they give up entirely (chaos).

Policy proliferation signals distrust. When leadership response to every mistake is "create a new policy," it signals that you don't trust staff judgment. This erodes culture and damages engagement, which directly undermines service excellence.

Maintenance burden multiplies. Every policy requires regular review and updates. Ten policies are manageable. Fifty policies are a burden. One hundred policies are impossible to keep current.

Consolidation improves usability. One complete policy that staff actually know is better than five fragmentary policies that nobody can track.

How to prevent policy proliferation:

Start with strong presumption against new policies. When someone proposes a new policy, ask:

- Is this truly needed or are we creating policy to address one incident?
- Could this be incorporated into an existing policy instead of creating a new one?
- Could training or communication address this instead of policy?
- Are we creating policy because we don't trust our staff? If so, is that the real problem?

Regularly consolidate. Periodically review your policy inventory with an eye toward consolidation:

- Could these three related policies become sections of one complete policy?
- Are these separate policies or should they be one policy with different sections?
- Could this standalone procedure be incorporated into a broader procedure?

Retire outdated policies aggressively. When policies no longer serve a purpose, retire them formally. Don't let them accumulate. Outdated policies create confusion and teach staff that policies are irrelevant.

Use guidelines instead of policies when appropriate. Not everything needs to be a mandatory policy. Guidelines and recommendations provide guidance while preserving flexibility and trusting judgment.

Ask "what's the worst that could happen?" If staff handle something differently than you'd prefer, what's the actual risk? If the risk is low, maybe you don't need a policy. Trust their professional judgment.

Focus on principles, not prescriptions. Principle-based policies (explaining what and why) are more powerful than rule-based policies (prescribing exact steps). Principles allow judgment. Rules remove it.

Challenge every "we should have a policy" impulse. Often the impulse to create policy comes from:

- One incident that made us uncomfortable
- Desire for control and predictability
- Assumption that more documentation equals better management
- Lack of trust in staff judgment

Examine these impulses before creating policies. Often, better solutions exist: training, communication, coaching individual performers, or just trusting your staff.

The policy portfolio review:

At least annually, review your entire policy portfolio:

How many policies do we have? Count them. If the number surprises you (most leaders are surprised how many have accumulated), that's a warning sign.

How many could staff name from memory? If the answer is "very few," your policies aren't effective guidance tools.

When were they last reviewed? If significant portions haven't been reviewed in 2+ years, they're probably outdated.

Which ones could be consolidated? Look for overlap, redundancy, and fragmentation. Consolidation opportunities exist in almost every policy portfolio.

Which ones could be retired? Technology changes. Processes evolve. Policies outlive their usefulness. Be aggressive about retirement.

Do they reflect our current values and culture? Policies written years ago may reflect old culture. If they contradict current values, they undermine culture.

The goal is maintaining a lean, effective policy environment that enables staff to deliver excellent service.

Policies That Reinforce Healthy Culture

Your policies don't just enable service, they shape culture. Every policy either reinforces your desired culture or undermines it.

Your policies must align with and reinforce those values. Misalignment destroys culture fast.

Policies and procedures should promote the organization's commitment to compliance and address specific areas of risk. But more than that, policies define the relationships, behavior, rules, and what is expected by various entities that interact with one another in an organization. By doing so, policies establish accepted company values and ethics, which form pillars of company culture.

Example misalignments that destroy culture:

Consider an organization that says "We trust our people" but requires manager approval for every decision, three signatures on every expenditure, and a two-week IT approval process for any software install. The stated value is trust. The lived policy is control. Staff learn instantly which one is real. These contradictions destroy credibility faster than any amount of good communication can rebuild it.

How to align policies with culture:

When creating or reviewing any policy, ask:

- Does this policy demonstrate trust in our staff or does it signal distrust?
- Does this policy enable good decisions or does it remove judgment?
- Does this policy enable service or does it create obstacles?
- Would I want to work in an organization with this policy?
- Does this policy reflect our stated values or contradict them?

Use your cultural values as filter for all policies:

Go back to your cultural values. For each major value, examine policies that relate to it:

Example: If "collaboration" is a core value:

- Do our policies encourage collaboration or create silos?
- Do they make it easy for teams to work together or do they create barriers?
- Do they reward collaborative behavior or just individual performance?

Example: If "customer focus" is a core value:

- Do our policies start with customer needs or IT convenience?
- Do they equip staff to solve customer problems or force them to follow rigid procedures?
- Do they make service easier or harder?

When policies contradict culture, you have two choices:

1. Change the policy to align with values
2. Acknowledge that this isn't really a value (if you're not willing to align policies, it's not a value)

Don't let contradictions persist. They destroy culture and undermine everything you're trying to build.

Policies as cultural reinforcement:

Well-designed policies actively reinforce culture:

Example supporting trust and empowerment: "Service desk staff are empowered to make decisions that serve customers effectively within these guardrails: [specific constraints]. When facing situations outside these guardrails, staff should use their best judgment to serve the customer, then document the situation for review. We trust our staff to make good decisions and learn from experience."

This policy explicitly supports trust and autonomy. It gives staff freedom within boundaries. It encourages judgment. It creates learning rather than punishment.

Example supporting continuous improvement: "Any staff member can propose improvements to policies, procedures, or processes. Proposals should include the problem being solved and the recommended solution. Small improvements can be implemented immediately by the policy owner with communication to affected staff. Larger changes follow our standard change process. We value initiative and welcome improvement ideas from everyone."

This policy makes improvement easy and encouraged. It reduces barriers. It signals that leadership values initiative.

The cultural test:

Imagine a new employee reads all your policies on their first day. What would they learn about your culture? What would they conclude about what's valued? About whether they're trusted? About whether they're trusted to serve customers?

If the cultural message from policies contradicts your stated values, you have work to do.

Principle-Based vs. Rule-Based Policies

One of the most important decisions in policy design: principle-based or rule-based?

Rule-based policies prescribe specific actions: "Do exactly these steps in this order. No deviation."

Principle-based policies establish outcomes and boundaries: "Achieve this outcome. Stay within these constraints. Use your judgment on how."

Both have appropriate uses. But principle-based policies generally enable service excellence while rule-based policies often constrain it.

The Lilly policy team reviewed local procedures to provide feedback and verify they met particular criteria: alignment with global policies and procedure templates, a focus on principles versus rules, ownership by local business leaders, and simplicity in writing, using clear and human terms. Their philosophy: "We need employees to understand our policies and procedures, and why they are important, so that they are equipped to apply good judgment every day."

Rule-based policies are appropriate when compliance requires exact steps, safety is critical and deviation is dangerous, or consistency matters more than flexibility: financial controls, data destruction procedures, and emergency response protocols are natural fits. A data disposal policy should specify exact steps: remove drives, document serial numbers, use approved shredding service, obtain destruction certificate. The consequences of deviation are serious enough to warrant prescribed execution.

Principle-based policies are better when situations vary significantly, professional judgment is needed, customer needs differ, or the field evolves rapidly, which describes most IT service delivery work. An effective service desk policy

establishes clear goals and boundaries, then trusts staff judgment within those boundaries: "Our goal is resolving the customer's issue as quickly and effectively as possible while maintaining security and data integrity. You have authority to make decisions that serve customers within these guardrails. When facing gray areas, use your best professional judgment and document your reasoning."

Most IT organizations default to too many rule-based policies because they feel safer. The shift toward principle-based approaches requires trust in your staff.

The principle-based advantage:

Principle-based approaches work. Studies show that scientists used a mix of formal rules and their own expert judgment to determine how and when they complied with regulations designed to prevent risks. They prioritized work tasks and collegiality with coworkers. The lesson: Managers should avoid imposing a one-size-fits-all approach, instead adapting regulations to a particular situation.

How to shift from rule-based to principle-based:

Many organizations have accumulated rule-based policies over years. Shifting to principle-based approaches requires deliberate effort:

Review existing rule-based policies: For each one, ask:

- What's the underlying principle this rule is trying to enforce?
- Could we state the principle and trust staff to implement it appropriately?
- What judgment do we trust our staff to exercise?
- Where do we need hard boundaries vs. guidance?

Rewrite to emphasize principles: Instead of listing steps, state the goal, explain why it matters, provide necessary boundaries, then trust execution.

Test with scenarios: When rewriting policies, test them with realistic scenarios. Can staff apply the principles effectively? Do the boundaries make sense? Is guidance sufficient?

Support with training: Principle-based policies require more judgment. Make sure staff understand the principles, the reasoning, and how to apply them. New employees especially need support learning to apply principles appropriately.

Create feedback loops: When staff apply principles in ways that don't work well, use it as learning opportunity, not reason to revert to rigid rules. Coach the individual, clarify the principle if needed, adjust boundaries if appropriate. But resist the urge to add rules every time something goes wrong.

Start where judgment matters most: You don't need to convert every policy. Start with areas where staff expertise is high, situations vary significantly, and customer service matters most. These are areas where principle-based policies deliver most value.

Enabling Staff Through Effective Policies

Let's return to the core theme of this module: leaders create the environment where engaged employees deliver service excellence.

Policies are part of that environment. The right policies, few in number, principle-based, created by people who do the work, aligned with cultural values, enable staff to serve customers effectively.

The wrong policies, proliferated over years, prescriptive and rigid, created by leaders who don't do the work, contradicting stated values, frustrate staff and kill service.

Your job as leader:

You're not the policy writer. You're the architect of the policy environment. You:

- **Establish the philosophy:** Policies enable service. Guardrails not handcuffs. Fewer and better. Aligned with values. Living documents. Created by doers.
- **Create the taxonomy:** Clear definitions of policies vs. standards vs. procedures vs. guidelines. Criteria for what needs what.
- **Build the governance:** Who creates, who approves, who maintains. Tiered based on scope and impact. Review cycles that make sure currency without bureaucracy.
- **Provide the infrastructure:** Content management systems that make policies findable, current, and accessible. Version control. Workflow. Search.
- **Model the behavior:** When you respect and follow policies, staff do too. When you bypass policies, staff learn policies don't matter. When you challenge policies that don't serve their purpose, staff learn that policies exist to enable work, not control it.
- **Hold people accountable:** Policy owners are accountable for keeping their policies current and useful. Leaders are accountable for keeping policies aligned with values. You're accountable for creating the environment where effective policies thrive.
- **Celebrate consolidation:** When teams consolidate fragmented policies, recognize it. When teams retire outdated policies, celebrate it. When teams create principle-based policies that support good judgment, highlight it as model for others.

This work matters for service excellence:

Good policies leave staff feeling trusted and equipped, they have clear guidance without feeling micromanaged, and they can use their judgment to serve customers well within understood boundaries.

Poorly written policies leave staff feeling micromanaged and distrusted. They spend more time working through policies than serving customers. They either follow the ones they remember (inconsistency) or they give up and improvise (chaos). Service suffers.

This connects directly to service excellence: Openly discussing the reasons behind rules and how they benefit everyone can increase acceptance, building a deeper understanding and a shift towards a culture of compliance driven by purpose, not authority.

Your policy environment either enables or undermines service excellence. There's no neutral. Make it an enabler.

How This Connects to the Broader Framework

Policies translate your governance decisions, cultural values, and service standards into the daily rules people follow:

Your leadership fundamentals (Module 1) are essential here:

- **Purpose clarity** (Section 1.1) ensures policies connect to mission, not just control behavior
- **Delegation** (Section 1.3) is essential, you empower policy owners, you don't write everything yourself
- Communication (Section 1.5) is what helps people understand policy intent, not just policy text

Organizational health (Module 2) shapes how policies land:

- **Culture** (Section 2.5) must align with policies, contradictions destroy culture
- **Communications** (Section 2.6) carries policy information and helps accessibility
- **Capability** (Section 2.4) enables staff to create good policies and apply principles appropriately

Strategic alignment (Module 3) gives policies direction:

- **Governance** (Section 3.1) provides structure for policy approval and oversight
- **Frameworks** (Section 3.3) often require supporting policies (NIST CSF, ITSM, etc.)
- **Service alignment** (Section 3.4) means policies should enable service, not hinder it

Looking ahead in Module 4:

- **Portfolio/Service Management** (Section 4.2) requires policies that enable flexibility
- **Knowledge Management** (Section 4.3) includes policy documentation and accessibility
- **Customer Service** (Section 4.4) depends on policies that enable staff to serve
- **Business Relationships** (Section 4.5) are strengthened when policies enable partnership

Policies aren't standalone documents. They're integrated into how your organization functions.

Key Takeaways

- Your role isn't writing policies. It's creating the environment where good policies emerge and thrive, grounded in clear principles rather than reactive rule-making
- Principle-based policies support staff judgment and enable service excellence. Rigid, prescriptive policies signal distrust and create workarounds
- Policy proliferation is a leadership failure. Fewer, better policies that staff know and follow outperform volumes of policies that gather dust
- A clear policy taxonomy, distinguishing policies from standards, procedures, and guidelines, prevents confusion and provides the right level of governance for each situation
- Policies must align with organizational culture. When policies contradict your stated values, culture wins and trust erodes
- Policy governance requires clear ownership, regular review cycles, and the discipline to retire outdated policies as deliberately as you create new ones
- The true measure of your policy environment is whether staff feel trusted and guided or controlled and frustrated

Reflection Questions

Reflect on these questions:

1. How many policies, procedures, standards, and guidelines does your IT organization have? Do you know? Could your staff list them?
2. What percentage of your policies were created by the people who actually do the work vs. created by leadership?
3. When was the last time you retired a policy? If you can't remember, that's a warning sign.
4. Do your policies reinforce your cultural values or contradict them? Pick three core values and examine policies related to each.
5. Are your policies principle-based (what and why) or rule-based (exactly how)? Which approach dominates?
6. Can staff find the policies they need within 3 clicks? Can they tell which are current? Do they trust that what they find is what they should follow?
7. When someone makes a mistake, is your first impulse to create a new policy or to coach the individual? What does your answer reveal about your philosophy?
8. If a new employee read all your policies on their first day, what would they learn about your culture? Would they feel trusted or controlled?

The working documents for this section are in Appendix A.4.1.

Section 4.2

Portfolio and Service Management

Here's a scenario that plays out in local government IT departments everywhere: The Sheriff's office asks IT to deploy a new case management system. IT says yes. Six months later, the District Attorney requests something similar for their prosecution tracking. IT builds it too. A year passes, and suddenly your IT team is supporting three different case management systems across public safety departments, each requiring maintenance, security patches, training, and support, while staff from each department complain that "the other departments have features we don't have."

Or consider this scenario: The City Manager asks the IT Director to present the department's service portfolio to the Council. The IT Director lists services: "We do email, phones, network, computers, printers, website, GIS, public safety systems, finance software…" The list reaches forty items before the City Manager interrupts: "Which of these are critical? Which ones cost the most? If we had to cut your budget by 10%, what would we stop doing?" The IT Director pauses. No one really knows the answers.

These aren't failures of technical competence. They're failures of portfolio management, and they're particularly common in local governments where IT staff are stretched thin, budgets are tight, and every department has urgent needs.

Portfolio and service management is the practice of understanding, organizing, and actively managing everything IT provides (services, applications, infrastructure, and projects) as an interconnected portfolio of investments. It answers fundamental questions: What do we support? Why? At what cost? What value does it provide to citizens and staff? What should we start, stop, or change?

This matters for service excellence in local government. You can't deliver great service without knowing what you're delivering. You can't support your staff when

they're spread across a tangle of poorly understood systems. And when the Agency Administrator asks tough budget questions, you can't make good investment decisions if you're managing technology piece by piece instead of as a portfolio.

Great local government IT leaders see their entire technology environment as a portfolio of investments that needs active management, regular evaluation, and clear alignment with community needs and organizational mission. They create clarity about what IT does, trust their teams to own specific services, and make transparent decisions about where to invest limited resources.

Understanding Portfolio Management in IT

What Is Portfolio Management?

In ITIL 4 terminology, portfolio management ensures that an organization has the right mix of programs, projects, products, and services to execute its strategy within funding and resource constraints. Think of it as viewing all your IT investments, not as isolated projects or individual systems, but as an interconnected collection that must be balanced, prioritized, and optimized for maximum organizational value.

Portfolio management operates at three levels:

Strategic Level: What should we invest in? Which services align with organizational mission? What should we stop doing? These are leadership decisions about direction and resource allocation.

Tactical Level: How do we organize our services, applications, and infrastructure for optimal management? Who owns what? How do we track performance and costs?

Operational Level: How do individual services, applications, and projects get delivered day-to-day? Service ownership and accountability live at this level.

As IT leaders, your primary focus is the strategic level, setting direction, making investment decisions, and creating the structures that enable effective tactical and operational management.

Why Portfolio Management Matters in Local Government

Without effective portfolio management, IT organizations can drift into several predictable problems:

Proliferation and Duplication: Each department wants its own solution. Public Works uses one work order system, Parks uses another, and Facilities wants a third. Before long, your IT team is supporting multiple systems that do essentially the same thing, none of them talking to each other, all consuming precious staff time and budget.

Invisible Costs: When the Board or Council asks what IT costs, you can quote your budget line items, but you can't explain what it costs to deliver email, or support the permitting system, or maintain the public safety network. Total cost of ownership is a mystery, making it nearly impossible to justify investments or demonstrate value.

Resource Fragmentation: In a smaller IT department, everyone wears multiple hats. Your network administrator also supports GIS. Your help desk person also manages the phone system. When no one has clear ownership of specific services, everything becomes partially everyone's responsibility, which means nothing is truly anyone's responsibility. Critical services get inconsistent attention.

Misaligned Investment: Department heads with the loudest voices or the strongest political relationships get their technology needs met first. Meanwhile, critical infrastructure investments that would benefit everyone, like upgrading aging network equipment or replacing end-of-life servers, get deferred year after year because they're not as visible or politically compelling.

Innovation Paralysis: Your team spends so much time maintaining the existing technology environment, patching servers, supporting applications, troubleshooting printers, resetting passwords, that there's no capacity for innovation. When the County Administrator asks about implementing online permitting or digital services for citizens, the honest answer is: "We're barely keeping up with what we have now."

As one IT consultant observes about public sector organizations, they hollow out their capacity to deliver services because they are so busy building and changing them without balancing priorities across all activity. This is especially acute in smaller governments where IT staff are already stretched thin.

Effective portfolio management solves these problems by creating visibility, accountability, and strategic coordination across your entire technology footprint, at a scale that's achievable for your team size and budget.

The Four Portfolios: The Full Picture

Modern IT departments must manage four interconnected portfolios: projects, applications, infrastructure, and services. Each has unique characteristics, but they must be managed as an integrated whole, not in isolation.

Service Portfolio: What We Deliver to Staff and Citizens

Your **service portfolio** represents everything IT provides to internal staff and external citizens, email, network access, application support, desktop services, data backup, website hosting, online services, public safety systems, and so on. The service portfolio ensures every service has business justification and delivers maximum value within managed risks and costs.

For a city of 75,000 people with a 15-person IT department, a well-managed service portfolio might include:

- **Core Infrastructure Services**: Network, email, file storage, internet access, backup/recovery
- **Business Application Support**: Financial system (Tyler Munis), permitting system, GIS, asset management
- **Public Safety Services**: CAD/RMS systems, records management, body cameras, evidence management

- **Citizen-Facing Services**: Website, online payments, permit applications, public records requests
- **End-User Services**: Desktop/laptop support, mobile devices, printing, phone system
- **Facility Services**: Building access systems, security cameras, public WiFi

The service portfolio typically consists of three parts:

Service Catalog (Active Services): These are the services currently available. They should be clearly defined, with documented service levels and support processes. This is customer-facing, department heads and staff should know what services exist and how to request them. In smaller governments, this doesn't need to be a fancy portal, a well-organized SharePoint site or even a clear PDF document works fine.

Service Pipeline (Services in Development): These are proposed or in-development services. Maybe you're implementing online building permits next year, or replacing the aging phone system. The pipeline helps elected officials and department heads understand what's coming and when to expect it.

Retired Services (Historical Record): Services that have been decommissioned. When you finally shut down that old AS/400 system that Accounting used for years, document why it was retired and what replaced it. This prevents future questions and avoids repeating mistakes.

Why this matters for local government leaders: The service portfolio creates transparency with your Board, Council, or elected officials. When they ask "what does IT do?", you have a clear answer. When departments request new services, you can show what you're already supporting and discuss trade-offs. When budget cuts loom, you can have rational conversations about which services could be reduced or eliminated rather than making arbitrary cuts.

Application Portfolio: What Systems We Support

Your application portfolio includes all software applications IT supports, from your ERP system (Tyler, Workday, CentralSquare, BS&A, Incode) to departmental tools like permitting software, GIS, asset management, document management, and specialized applications for public safety, public works, or recreation. Application portfolio management helps categorize applications based on business value, technical health, and strategic alignment to prioritize investments, rationalize the portfolio, and optimize resource allocation.

Not all applications are equal in a local government context:

- Your financial/ERP system is mission-critical, payroll and accounts payable must work
- Your CAD/RMS system for dispatch and police is critical for public safety
- The permitting system generates revenue and serves citizens directly

- That custom Access database the Planning Department built in 2008? It's a liability
- The specialized mapping tool only one GIS person knows how to use? It's a risk

Application portfolio management asks critical questions:

- Which applications truly support our core mission of serving citizens?
- Which overlap or duplicate functionality across departments?
- Which are expensive to maintain relative to value (annual maintenance fees, staff time)?
- Which are approaching end-of-life and need replacement planning?
- Which could be consolidated (do we really need three different work order systems)?
- Which are unsupported "shadow IT" that create security or succession risks?

Why this matters for local government leaders: Your application portfolio is where money goes. In a typical small government IT budget, 40–60% goes to software licenses and maintenance. The application portfolio reveals whether you're getting value for that investment. It enables strategic rationalization, maybe consolidating three work order systems into one, or retiring that legacy system that requires keeping an old server running.

A common rule of thumb for balanced portfolio allocation is approximately 30% for infrastructure maintenance, 50% for existing product enhancements, and 20% for new ventures. But without clear portfolio management, the mix often skews to 70% maintenance, 25% firefighting, and 5% innovation, if you're lucky.

Infrastructure and Technology Portfolio: What Platforms Keep Everything Running

Your **infrastructure portfolio** includes the hardware, networks, platforms, and technologies that power your services, servers (physical or virtual), storage, networking equipment, wireless systems, cloud services (Microsoft 365, Azure), phone systems, and core technologies. Effective infrastructure portfolio management makes sure these assets are optimized for performance and cost.

In smaller local governments, infrastructure decisions have particularly long-lasting implications because replacement cycles are measured in years and budgets are tight:

- That server infrastructure you're replacing this year? It'll need to serve you for 5–7 years
- The decision to move email to Microsoft 365 isn't just technical, it changes your cost structure entirely from CapEx to OpEx and affects every employee
- Your network infrastructure (switches, WiFi, cabling) shapes what services you can deliver for the next decade

- Technology choices (Windows vs. Linux, physical servers vs. cloud, on-premises vs. SaaS) determine what skills your team needs

This matters because: Infrastructure decisions shape your IT trajectory for years. An agency with 25 IT staff can't easily reverse infrastructure decisions, if you migrate to the cloud and it doesn't work out, you can't easily come back. These decisions require careful thought about:

- **Long-term costs**: That cloud migration might cost more over 10 years than on-premises
- **Staff capability**: Can your team manage this technology? What happens when your one VMware expert retires?
- **Vendor dependencies**: Are you putting too many eggs in one vendor's basket?
- **Disaster recovery**: How do you recover if something fails? In most local governments, you are the disaster recovery plan.

Infrastructure portfolio management means understanding what you have, what condition it's in, when it needs replacement, and what it will cost, so you can plan ahead rather than react to emergencies when the aging SAN fails catastrophically.

Project Portfolio: What Changes We're Making

Your **project portfolio** contains initiatives that change or create services, applications, or infrastructure. In local government, projects compete for extremely limited resources, mainly staff time, since your people are the scarcest resource. Project portfolio management ensures each project supports strategic goals and is completed within available capacity.

In a typical local government IT department, the project portfolio might include:

- Replacing the aging financial system (major multi-year effort)
- Implementing online building permits (Council priority)
- Upgrading network switches in the aging public safety building
- Migrating file servers to SharePoint/OneDrive
- Deploying body cameras for police (state mandate)
- Replacing end-of-life phone system
- Implementing new GIS aerial photography

The challenge? Your 25-person IT team is already fully committed to keeping everything running. Each project requires staff time, and when your network administrator spends 20 hours a week on the phone system replacement project, something else doesn't get done.

Without project portfolio management, local government IT organizations suffer from:

- **Too many commitments**: IT says "yes" to everything, then can't deliver, damaging credibility

- **Strategic misalignment**: Politically visible projects get done while critical infrastructure replacement gets deferred
- **Hidden resource conflicts**: Two major projects both need your database administrator, but nobody realized it until both projects are delayed
- **No visibility for leadership**: The City Manager doesn't understand why IT can't start the permitting project, they don't see that staff are already maxed out

Why this matters: The project portfolio is where council priorities meet reality. When the Board approves five new IT initiatives but you only have capacity for two, portfolio management gives you the approach to make transparent choices about priorities, timing, and trade-offs. It prevents your team from being set up to fail by taking on more than they can deliver.

Creating a Service Ownership Culture in Teams

Portfolio management is about **creating a culture of ownership and accountability** where every significant service, application, and technology has someone who feels personally responsible for its management and continuous improvement, even in teams of 5–15 people where everyone wears multiple hats.

From Operators to Owners

In many government IT departments, staff function as generalists and firefighters, they respond to whatever's broken, fulfill whatever's requested, and keep systems running. They do what they're told. In a 10-person team, your "network administrator" also supports GIS, manages the phone system, and helps with the website. This "everyone does everything" approach creates a transactional relationship with work that leads to mediocre service.

Great service comes from **ownership**, when someone feels personally accountable for a service's success, even if they're not the only person who works on it. When people have an ownership mindset, they take responsibility for outcomes and are trusted to make decisions that will lead to those outcomes. Accountability and authority must go hand in hand.

Service ownership transforms how staff engage with their work:

- **Operators** fix the email server when it crashes. **Owners** monitor email performance, plan capacity, and prevent outages before they happen.

  Operators deploy software updates when vendors release them. **Owners** test updates first, schedule deployment to minimize disruption, and communicate changes to users.

- **Operators** restore the nightly backup when the file server fails. **Owners** regularly test backup recovery, monitor backup success rates, and document the recovery process.

- **Operators** say "I'll have to check with my supervisor." **Owners** make decisions within their scope and take initiative.

Service ownership doesn't mean working alone, it means being the quarterback for that service, coordinating with teammates and knowing who to pull in when needed.

Trusting Service Managers

The basis of service ownership is **assigning specific individuals as service managers** for every significant service, application, or technology in your portfolio. In a smaller IT department, each person might be the service manager for 3–5+ services.

For example:

- **Systems Administrator**: Email (Office 365), File Storage, Backup/DR, Server Infrastructure
- **Network Administrator**: Network, WiFi, Phone System, Internet/Firewall
- **GIS Analyst**: GIS Applications, Mapping Services, Online Maps, Parcel Data
- **Application Support**: Financial System, Permitting, Asset Management, Website
- **Help Desk Lead**: Desktop/Laptop Support, Mobile Devices, Printing, Account Management

Service managers need:

Clear Scope and Authority: They must know exactly what they're responsible for and have genuine authority to make decisions about their service. Yes, they should consult the IT Director on major decisions, but they should handle day-to-day service decisions themselves.

Realistic Expectations: In small teams, service management is part of the job, not the whole job. Your network administrator can't spend 40 hours a week on network service management, they have 10 hours a week for management, planning, and improvement. The other 30 hours are reactive support and projects. Set expectations accordingly.

Time for Management Activities: Your people need dedicated time for service management work, documenting procedures, planning updates, monitoring performance, meeting with customers. If they're 100% reactive, they can't manage services effectively.

Connection to Mission: Help them understand how their services support citizen services and organizational mission. When your backup administrator understands that reliable backup means the County can recover from ransomware without paying criminals, that creates meaning.

Support for Continuous Improvement: Encourage incremental improvement. Maybe this quarter, the email service manager improves documentation. Next quarter, they implement better monitoring. Small steps add up.

Addressing Cultural Resistance

Implementing service ownership isn't always easy. You may encounter resistance:

"I don't want the additional responsibility": Some staff prefer simply being told what to do. They resist increased accountability. This requires honest conversations about professional growth and organizational needs. Not everyone will embrace ownership, and that's okay. But your high performers will.

"I don't have time for planning and management": Staff accustomed to fighting fires may see service management activities as taking time away from "real work." Leaders must help staff understand that **planning and managing IS real work**, and that fire-fighting is often the symptom of inadequate planning.

"This service is shared, everyone works on it": Shared responsibility often becomes no responsibility. While collaboration is essential, someone must be the clear owner with ultimate accountability.

"We've always done it this way": Inertia is powerful. Implementing service ownership represents cultural change that requires persistent leadership, clear communication, and demonstrable wins to build momentum.

Creating a culture of ownership requires leaders to focus on the "why", emphasizing the impact rather than just the outcome. As research on organizational ownership shows, creating a culture of constant improvement is more important than hitting specific targets. When staff understand how their service ownership contributes to mission and feel trusted to improve, resistance melts into engagement.

Leadership Actions and Decisions

Strategic Portfolio Decisions

As an IT leader, you must make ongoing strategic decisions about your portfolios:

What services should we offer (and not offer)? Every service costs money and consumes staff capacity. Leaders must be willing to say "no" to requested services that don't align with mission or that the organization cannot support effectively.

What service levels should we commit to? Not everything needs 24/7 support or two-hour response times. Service levels should match importance and be sustainable for staff.

How do we allocate resources across the portfolio? Portfolio management emphasizes prioritizing services and projects based on their contribution to business objectives, value, and strategic alignment. It requires difficult choices investing more in strategic areas means investing less elsewhere.

When should we retire or consolidate? Services, applications, and technologies have lifecycles. Leaders must be willing to sunset outdated or redundant systems, even when doing so is politically difficult.

How do we balance innovation and stability? Too much focus on new services starves existing ones. Too much focus on maintaining what exists prevents innovation. Finding the right balance is an ongoing leadership challenge.

Creating Transparency Through Portfolio Visibility

Portfolio management creates **transparency** about what IT does and what it costs. This transparency is essential for several reasons:

Customer Understanding: When customers can see the service catalog, they know what's available and what to request. They understand service levels and support processes. This reduces confusion and unrealistic expectations.

Resource Justification: When leadership can show the Board or executive team exactly what IT supports, and what it costs, IT is in a stronger position to justify resources and push back on unfunded mandates.

Investment Decisions: When you can clearly see your entire portfolio, investment decisions become more rational. You can identify redundancies, spot gaps, and make informed choices about where to invest.

Staff Clarity: When staff understand the portfolio and their role within it, they have clarity about priorities and expectations. They know what matters most.

Implementing Service Level Thinking

An important aspect of portfolio management is **service level thinking**, defining clear expectations for what each service provides and at what level of quality. This doesn't require formal SLAs for everything, but it does require clarity:

- What hours is this service available?
- How quickly will we respond to issues?
- What level of reliability should customers expect?
- What are our maintenance windows?
- What support channels are available?

Service level thinking prevents the trap where IT inadvertently commits to unsustainable levels of service because expectations were never clearly defined. It also enables honest conversations with customers: "If you need 24/7 support for this application, we'll need additional resources."

Practical Tools and Outputs (Right-Sized for Smaller Governments)

While the focus should remain on strategy and culture, leaders should be aware of practical tools that enable effective portfolio management, at a scale that works for teams of 5–50 people, not enterprise IT departments:

Service Catalog: Don't overthink this. For many small governments, a well-organized SharePoint page or even a clear PDF document listing available services, how to request them, and expected response times is perfectly adequate. The point is transparency, not technology. If department heads can find the information easily, you've succeeded.

Service Inventory: A simple spreadsheet or database tracking all services IT provides, including:

- Service name and description
- Service manager (owner)
- Key users/departments served
- Related applications/systems
- Estimated annual cost (staff time + licenses/maintenance)
- Status (Active, Pipeline, Retired)

This doesn't need to be fancy. An Excel file maintained by the IT Director works fine for a 10-person team. The value is in having the information, not in the tool.

Application Registry: Another spreadsheet tracking all applications:

- Application name
- Vendor/developer
- Primary purpose/departments served
- Service manager
- Annual cost (licensing, maintenance)
- Contract renewal date
- Technical status (current, aging, end-of-life)
- Business value assessment (critical, important, nice-to-have)

This becomes invaluable during budget season or when evaluating consolidation opportunities.

Technology Lifecycle Roadmap: A simple timeline showing when major infrastructure needs replacement:

- "These network switches are 8 years old, need replacement in FY 2027, estimated cost $85K"
- "Phone system reaching end-of-life in FY 2028, exploring cloud options"
- "Server infrastructure refreshed in FY 2024, good through FY 2030"

This prevents surprises and enables multi-year capital planning.

Project Priority Matrix: A simple grid showing all requested projects rated on two dimensions:

- Strategic value (High/Medium/Low)
- Resource requirement (Heavy/Moderate/Light)

High-value, low-resource projects go first. Low-value, high-resource projects go last (or never). Now there's transparency about why some projects happen and others don't.

Monthly Portfolio Dashboard for Leadership: A one-page monthly or quarterly report for the City Manager or County Administrator showing:

- Current service status (any major outages or issues?)

- Project status (on track, at risk, delayed)
- Resource use (how much project capacity is available?)
- Upcoming decisions needed (contract renewals, system replacements)
- Budget status (spending on track?)

The key principle: **keep tools simple and sustainable**. A small IT team can't maintain complex portfolio management systems. Use tools you already have (Excel, SharePoint, simple databases). Focus on capturing essential information that enables better decisions, not exhaustive data that's impressive but never used.

The best portfolio management tool is the one your team will maintain and use. Again, perfect is the enemy of good.

The Connection to Service Excellence

Portfolio and service management directly enable service excellence through several mechanisms:

Clarity Enables Quality: When staff know exactly what services they're responsible for, with clear service levels and adequate resources, they can deliver quality service. Ambiguity is the enemy of excellence.

Ownership Drives Improvement: Employees with a strong sense of ownership don't just care about achieving goals, they go the extra mile. Service managers who feel true ownership continuously improve their services because the service's success becomes personal.

Strategic Alignment Keeps You Relevant: When portfolio decisions connect back to mission, you end up delivering services people actually care about, instead of spreading resources across everything equally.

Transparency Builds Trust: When customers understand what services are available and what to expect, trust increases. When leadership can clearly explain IT's portfolio and costs, IT gains credibility.

Resource Balance Prevents Burnout: When the portfolio is actively managed, with clear decisions about what to support, what to retire, and how to allocate resources, staff aren't stretched impossibly thin across too many commitments. This sustainable workload enables quality service.

Portfolio and service management creates the structural backbone of service excellence. It's the framework that enables your staff to deliver great service consistently.

What Comes Next

Effective portfolio and service management requires:

Leadership Commitment: You must personally champion service ownership, make tough portfolio decisions, and create accountability structures that support staff.

Cultural Patience: Building an ownership culture takes time. Not everyone will embrace it immediately. Expect resistance, address it honestly, and celebrate wins that demonstrate the value of ownership.

Incremental Implementation: Don't try to implement full portfolio management overnight. Start with high-priority services, prove the value, and expand. As research on ITIL portfolio management confirms, organizations must take an agile approach to review and reprioritize initiatives regularly to keep portfolios relevant.

Continuous Refinement: Portfolio management is not a one-time exercise. Services evolve, technologies change, organizational priorities shift. Leaders must continuously review and adjust the portfolio to remain aligned with mission.

Balance Across Portfolios: Remember to balance investment across all four portfolios, services, applications, infrastructure, and projects. Overemphasis on one area at the expense of others creates imbalance and risk.

Portfolio and service management isn't glamorous work. It won't generate headlines or win awards. But it is fundamental to everything else you're trying to accomplish. Without knowing what you're managing, trusting people to own it, and making strategic decisions about investment, nothing else matters.

Great IT leaders understand that creating clarity, accountability, and strategic alignment through portfolio management is how they enable their people to deliver the excellent service that the organization deserves.

How This Connects to the Broader Framework

Portfolio and service management provides the structural backbone for service delivery. It makes visible what you support, why, and at what cost:

The leadership skills from Module 1 directly apply:

- **Purpose clarity** (Section 1.1) grounds portfolio decisions in organizational mission, not technical preference
- **Time management** (Section 1.2) means protecting time for strategic portfolio reviews rather than getting lost in daily operations
- ***Political skills (Section 1.4)*** help you have the difficult conversations when portfolio decisions mean saying no to influential department heads

Your organizational health work (Module 2) enables this:

- **Vision** (Section 2.2) provides the strategic direction that guides portfolio investment decisions
- **Organizational structure** (Section 2.3) determines how service ownership is distributed across your team
- **Capabilities** (Section 2.4) determine whether your staff can take on service ownership responsibilities

- **Culture** (Section 2.5) determines whether ownership culture takes root or feels like additional burden

Module 3's strategic alignment provides the backbone:

- **Governance** (Section 3.1) provides the decision-making structure for portfolio investment and retirement decisions
- **Strategic planning** (Section 3.2) sets the priorities that shape your portfolio roadmap
- **Frameworks** (Section 3.3) provide the operational standards your services must meet
- **Budget** (Section 3.5) allocates the resources that fund your service portfolio

Connecting forward in Module 4:

- **Knowledge management** (Section 4.3) captures the institutional knowledge that supports service continuity
- **Customer service** (Section 4.4) translates your well-managed portfolio into excellent customer experience
- **Business relationships** (Section 4.5) are strengthened when you can clearly articulate what IT delivers and at what cost

And looking ahead to Module 5:

- Portfolio visibility enables data-driven improvement prioritization
- Service ownership creates accountability for continuous service improvement

Portfolio management isn't a standalone administrative exercise. It's the connective tissue between your strategic decisions and your operational delivery.

Key Takeaways

- Portfolio management means managing together services, applications, infrastructure, and projects as interconnected investments
- Service ownership culture, where staff feel personally accountable for specific services, drives continuous improvement and quality
- Leaders must make strategic decisions about what to support, what service levels to provide, and how to allocate limited resources
- Transparency through service catalogs and portfolio visibility builds trust with customers and enables informed investment decisions
- Effective portfolio management creates the structural backbone that enables staff to deliver service excellence

Reflection Questions

Assess your portfolio and service management practices:

1. If your Board or Council asked you to list your top 20 services and explain their value and cost, could you answer confidently? If not, what's the first step toward that clarity?
2. Do your IT staff function more as reactive firefighters or as owners of their services? What would help them to take more ownership?
3. When departments request new systems or projects, how do you decide what gets done and what doesn't? Is your prioritization process transparent and defendable to elected officials?
4. What redundancies or outdated systems exist in your portfolios that should be retired or consolidated? What's preventing you from addressing them?
5. If budget cuts were required, could you clearly explain which services would be affected and what the community impact would be? Or would cuts be arbitrary?

The working documents for this section are in Appendix A.4.2.

Section 4.3

Knowledge and Domain Management

When I started implementing our Service Management Framework at a county I worked with, I thought the hardest part would be getting staff to accept new responsibilities and accountability. I was wrong.

The hardest part was realizing how much critical knowledge lived in people's heads, and nowhere else.

We had systems that only one person really understood. Procedures that existed only in someone's memory. Vendor relationships that were completely dependent on personal connections. When that person went on vacation, got sick, or left the organization, we were in trouble.

But the problem wasn't just individual knowledge silos. We also had unclear boundaries between our IT divisions. The network team and the applications team would both start working on the same problem without talking to each other. The help desk would escalate issues to the wrong group. Projects would stall because nobody was sure whose domain they fell into.

Knowledge management and domain management are two sides of the same coin. You need systems and culture that capture and share knowledge effectively. And you need clear organizational boundaries that enable collaboration rather than creating territorial disputes.

Both are essential for service excellence. And both require deliberate leadership.

Knowledge Management - Building Your Service Knowledge Foundation

Knowledge management in IT isn't about creating vast databases that nobody uses. It's about making sure the right information is available to the right people at the right time, especially when they need to solve problems or make decisions quickly.

The IT Infrastructure Library (ITIL) calls this the Service Knowledge Management System (SKMS), an approach to capturing, organizing, and sharing knowledge across IT services. For most local government IT organizations, you don't need the full complexity of an enterprise SKMS. But you do need the core principles.

The Basic Concept: Knowledge as a Strategic Asset

Start by thinking about knowledge the way you think about any other critical asset. You wouldn't leave expensive equipment sitting around unprotected and unmanaged. You shouldn't leave critical knowledge unprotected and unmanaged either.

Organizations that manage knowledge well report significantly faster problem resolution times and meaningful reduction in repeat incidents. That's not just efficiency, that's better service for your customers.

Knowledge management has three layers:

1. **Data**: Raw facts and figures (server configurations, user counts, error logs)
2. **Information**: Processed data that has context (trend analysis, performance reports, incident patterns)
3. **Knowledge**: Information combined with experience and judgment (what these patterns mean, how to respond to specific situations, why certain approaches work better than others)

Most organizations are pretty good at managing data. They're okay at managing information. They're terrible at managing knowledge.

Practical Implementation: Start Simple, Build Gradually

You don't need expensive knowledge management software to get started. You need consistent practices and cultural commitment.

Begin with a simple knowledge repository, SharePoint, a wiki, even a well-organized shared drive. The tool matters less than the discipline of using it consistently.

Focus on capturing knowledge in these critical areas:

System Documentation: Not just technical specifications, but operational knowledge. How do you troubleshoot this system? What are the common failure patterns? Who are the key vendor contacts? What works, what doesn't, and why?

Incident Resolution: When your team solves a problem, especially a difficult or unusual one, capture not just what was done but why that approach was chosen. What was tried first that didn't work? What clues led to the solution? This becomes invaluable when similar issues arise.

Process Knowledge: Your formal procedures are important, but process knowledge goes deeper. Why do we do things this way? What are the exceptions to the rule? When is it appropriate to deviate from standard process?

Vendor and Partner Relationships: Who knows whom? What's the history of different vendor relationships? Which support engineers are most helpful? What escalation paths work?

Lessons Learned: Both from successes and failures. What worked well on that major project? What would you do differently next time? This organizational memory prevents you from repeating mistakes and helps you replicate successes.

Make knowledge capture part of normal workflow, not an additional burden. When someone closes an incident ticket, they should briefly document what they learned. When a project concludes, there should be a quick lessons-learned session. When a new team member joins, their questions and learning process should be captured for the next new person.

Cultural Foundation: Making Knowledge Sharing Natural

Knowledge sharing has to be embedded in your organizational culture, not just mandated through policy.

People share knowledge when:

- **They feel psychologically safe** doing so (they won't be criticized for not knowing something or for asking questions)
- **They see personal benefit** in sharing (recognition, reduced interruptions, better team performance)
- **The organization recognizes and rewards** knowledge sharing behaviors
- **Leaders model** knowledge sharing themselves

People hoard knowledge when:

- **Knowledge is seen as job security** ("If I'm the only one who knows this, they can't get rid of me")
- **Sharing knowledge isn't valued** or recognized
- **People are too busy** to take time to document what they know
- **Previous sharing efforts** were ignored or unused

Knowledge-sharing behavior is primarily driven by organizational culture rather than technology systems, with trust and leadership support being the most critical factors.

Your job as a leader is to create an environment where knowledge sharing is natural, valued, and rewarded. This means:

Modeling vulnerability: Ask questions publicly. Admit when you don't know something. Show that learning and knowledge-seeking are signs of strength, not weakness.

Recognizing contributors: Publicly acknowledge when someone documents something useful, helps a colleague learn, or shares knowledge that prevents problems. Make knowledge sharing a visible part of performance evaluation.

Providing time and tools: Knowledge sharing takes time. If you want people to document what they know, you have to give them time to do it. If you want them to use knowledge systems, those systems have to be easy to use and helpful.

Connecting knowledge to service: Help people see how knowledge sharing directly improves the service they provide to customers. When knowledge sharing prevents a service outage or helps solve a customer problem faster, celebrate that connection.

Domain Management - Making Your Organizational Structure Work in Practice

You established the formal structure, who reports to whom, how teams are organized, what roles exist. Domain management is about making that structure work effectively in the day-to-day reality of serving customers.

Because we learned something there: having clear organizational charts doesn't automatically create clear operational boundaries. You can have perfect reporting relationships on paper while still having confusion, duplication, and territorial conflicts in practice.

Domain management translates your organizational structure into operational clarity. It answers the questions that org charts can't: When work crosses team boundaries, who does what? How do you coordinate without creating bureaucracy? How do you maintain expertise while enabling collaboration?

Building on Your Organizational Foundation

You already have some key building blocks in place:

- **Clear role definitions** that specify accountability and authority
- **Reporting relationships** that support both specialized expertise and cross-functional collaboration
- **Communication pathways** that enable coordination without overwhelming people
- **Decision-making frameworks** that clarify who has authority over what decisions

Domain management takes these core elements and operationalizes them for service delivery.

Think of organizational structure as the skeleton and domain management as the nervous system. The skeleton provides the framework, but the nervous system enables coordinated movement and response.

Defining Operational Domains Within Your Structure

Your organizational structure creates teams and reporting relationships. Your domain definitions create operational boundaries and coordination protocols.

These aren't always the same thing. You might have one person who organizationally reports to the infrastructure manager but operationally works across

both infrastructure and applications domains. Or you might have a security function that's organizationally embedded within infrastructure but operationally touches every domain.

Start by mapping your current operational reality:

Infrastructure Domain: Physical and virtual infrastructure, networks, storage, core connectivity, monitoring systems. This usually includes the foundational technology that everything else depends on.

Applications Domain: Business applications, databases, integrations, custom development, application support. This focuses on the technology that directly serves business functions.

End User Domain: Workstations, mobile devices, user account management, help desk, training, user-facing support. This is where most customer interactions happen.

Security Domain: This might be embedded within other domains or standalone, depending on your size and expertise. Includes cybersecurity, compliance, risk management, identity management.

Specialized Domains: GIS, public safety systems, financial systems, or other areas that require specialized expertise and serve specific departmental needs.

The key insight from our implementation: people can work across multiple domains, but every system and service needs one clearly defined primary domain owner. This isn't about limiting who can work on what, t's about creating accountability and preventing things from falling through cracks.

Enabling Cross-Domain Collaboration Without Chaos

That's where many organizations struggle. They either create rigid silos that can't work together, or they create such fluid boundaries that nobody knows who's responsible for what.

The solution is structured flexibility, clear primary ownership with well-defined collaboration protocols.

Primary and Secondary Responsibilities: Every system, service, and function should have a clearly identified primary domain owner who is ultimately accountable for its performance. But it should also have defined secondary support roles, escalation paths, and collaboration requirements.

For example, email might be primarily owned by the Infrastructure domain (because it's a core service that affects everyone), but the Applications domain might have secondary responsibility for mail-enabled business applications, and the End User domain might handle user training and mailbox management.

Cross-Domain Work Protocols: Most customer requests require multiple domains. Setting up a new employee touches Infrastructure (network accounts), Applications (business system access), End User (equipment and training), and Security (permissions and compliance).

You need standard protocols for how this coordination happens:

- Who initiates cross-domain work?
- How do domains communicate about dependencies and timelines?
- How do you track progress across multiple domains?
- How do you keep customers informed without overwhelming them with internal coordination details?

Escalation and Decision-Making Authority: When domains disagree or when issues escalate beyond single-domain expertise, you need clear decision-making frameworks:

- Technical decisions should generally flow to the domain with the most expertise and impact
- Resource allocation decisions need clear priority frameworks
- Customer service decisions should favor the domain closest to customer impact
- Strategic decisions require coordination at the leadership level

Preventing Territorial Behavior While Maintaining Expertise

Domain expertise is valuable. Territorial behavior is destructive. Your job as a leader is to encourage the first while preventing the second.

This requires constant attention to culture and incentives:

Reward collaboration, not just individual domain performance: Recognize and celebrate when domains work together successfully. Make cross-domain collaboration a visible part of performance evaluation.

Address territorial behavior immediately: When you see people protecting "their" systems, blocking information sharing, or refusing to collaborate, address it quickly and directly. Make it clear that customer service trumps domain pride.

Create opportunities for cross-domain understanding: Regular cross-training, job rotation, or "lunch and learn" sessions where domains share what they do. Empathy grows, and people stop seeing other domains as obstacles.

Model collaborative leadership: Show that you naturally work across domains, ask questions that span boundaries, and make decisions that prioritize overall service quality over any single domain's convenience.

Make domain boundaries permeable, not rigid: People should be able to contribute outside their primary domain when they have relevant expertise or when customer needs require it. Domain boundaries are about accountability, not about limiting capability.

Connecting Domains to Customer Value

This connects back to the customer focus you established in your organizational structure work. Every domain should be able to clearly articulate how their work creates value for customers, both internal departments and external citizens.

When domains understand their role in the larger service delivery chain, they're more likely to collaborate effectively and less likely to get caught up in internal politics or territorial disputes.

Regular discussions about customer impact, service quality metrics that span domains, and customer feedback that reaches all domains help maintain this external focus.

Domain management isn't about creating internal efficiency for its own sake. It's about organizing your technical expertise and operational capacity to serve customers better. When domains work well together, customers get faster response times, more consistent service, and solutions that address their actual needs rather than fitting neatly into internal organizational boxes.

Connecting Knowledge and Domain Management

Knowledge management and domain management reinforce each other. Good domain definition makes it easier to organize knowledge, you know where information belongs and who's responsible for maintaining it. Good knowledge management makes domain collaboration smoother, people have access to the information they need to work across boundaries effectively.

Both require the cultural groundwork you've built. They require the clear governance and communication structures. And they enable the service excellence and continuous improvement work ahead.

The goal isn't bureaucracy. It's clarity. When people know what they're responsible for and have access to the knowledge they need to fulfill those responsibilities, they can focus on serving customers instead of wading through internal confusion.

That's the basis of service excellence.

How This Connects to the Broader Framework

Knowledge and domain management reinforce and enable work from every previous module. Institutional knowledge is the invisible asset that keeps an organization running:

Module 1 leadership competencies come into play:

- **Purpose clarity** (Section 1.1) makes sure knowledge sharing serves organizational mission, not just internal efficiency
- **Time management** (Section 1.2) requires protecting time for knowledge transfer and cross-domain collaboration
- **Delegation** (Section 1.3) is only effective when people have access to the knowledge they need to succeed
- **Communication** (Section 1.5) principles apply directly to knowledge sharing and domain coordination

The organizational health you built in Module 2 matters here:

- **Leadership team** (Section 2.1) must model knowledge sharing and cross-domain collaboration
- **Vision and purpose** (Section 2.2) create the "why" that motivates knowledge sharing behavior
- **Organizational structure** (Section 2.3) provides the groundwork that domain management operationalizes
- **Capabilities and people** (Section 2.4) development depends on effective knowledge transfer
- **Culture** (Section 2.5) determines whether knowledge sharing happens or just gets mandated
- **Communications** (Section 2.6) systems enable both knowledge sharing and domain coordination

Your strategic alignment work (Module 3) provides direction:

- **Governance** (Section 3.1) provides frameworks for knowledge management and domain decision-making
- **Strategic planning** (Section 3.2) requires knowledge about organizational capabilities and domain expertise
- **Frameworks and standards** (Section 3.3) include knowledge management standards and domain operation guidelines
- **Service alignment** (Section 3.4) depends on domains working together to deliver customer value
- **Budget decisions** (Section 3.5) require understanding domain capabilities and knowledge gaps

Within Module 4, this connects forward:

- **Customer service** (Section 4.4) improves when staff have access to the knowledge they need and domains collaborate effectively
- **Business relationship management** (Section 4.5) requires knowledge about customer needs and domain capabilities

Looking ahead to continuous improvement (Module 5):

- Knowledge management enables learning from experience and sharing improvements across domains
- Domain management provides the organizational foundation for implementing improvements systematically

This goes beyond internal organizational work. Knowledge and domain management directly impact your ability to serve customers effectively, respond to changing needs, and build organizational capability over time.

Key Takeaways

- Knowledge management has three layers: data, information, and knowledge. Most organizations manage data adequately, handle information reasonably, and manage knowledge poorly
- The single point of failure problem is real and persistent. Your goal isn't eliminating specialization but ensuring that no single person's absence can cripple your ability to serve customers
- Start simple. A well-organized shared drive with consistent practices beats expensive knowledge management software that nobody maintains
- Domain management creates clear ownership and accountability for every system, service, and business area your organization supports. When everything is everyone's responsibility, nothing gets the attention it deserves
- Cross-domain collaboration requires intentional design: clear primary and secondary responsibilities, established work protocols, and escalation paths that prevent territorial behavior
- Knowledge transfer must be built into how you manage talent and plan for succession, not treated as an afterthought when someone gives notice
- Both knowledge and domain management are ongoing leadership challenges, not one-time implementations. They require continuous attention as your organization evolves

Reflection Questions

Assessing your knowledge and domain management maturity:

1. If your most knowledgeable system expert left tomorrow, how long would it take to restore normal operations? What does that tell you about your knowledge transfer practices?
2. Can a new team member find the documentation they need to understand a system or process without asking someone to guide them through it?
3. Does every critical system and service have a clearly identified owner and at least one knowledge shadow who could step in during an absence?
4. When was the last time you conducted a structured knowledge transfer for a departing employee? Did you start early enough?
5. How do your domain boundaries work in practice? Do they enable collaboration and clear accountability, or do they create territorial silos?
6. What percentage of your organization's critical operational knowledge exists only in people's heads rather than in accessible documentation?
7. How would you rate your team's willingness to share knowledge across domain boundaries? What would improve it?

The working documents for this section are in Appendix A.4.3.

Section 4.4

Customer Service

A CIO I know took over an IT department with a troubling reputation. Staff were technically competent, systems worked reasonably well, but customers consistently rated IT service as poor. Exit interviews revealed a common theme: "IT knows their stuff, but they make you feel like you're interrupting them."

The CIO met with the team to discuss the feedback. One senior technician responded defensively: "We're here to fix technology problems, not hold people's hands. If they'd just follow the documentation, they wouldn't need to bother us."

This statement revealed the real problem. The team saw customer service as something separate from their technical work, an interruption rather than their primary purpose. They had confused *technical competence* with *service excellence*.

Here's what this CIO understood that many IT leaders miss: **You cannot mandate customer service excellence. You can only build an environment where it naturally emerges from engaged employees who are trusted and equipped to do what's right for customers.**

The research is unequivocal on this point. Organizations with high employee satisfaction consistently demonstrate high customer satisfaction, and companies that frequently measure customer satisfaction achieve higher customer experience scores. More directly, engaged employees create better customer experiences because they are emotionally invested in outcomes rather than simply completing transactions.

This is the service culture paradox: The harder you push for better customer service through mandates and controls, the worse it tends to get. But when you create an environment where employees are engaged, trusted, and proud of their work, service excellence becomes the natural result.

Customer service excellence in IT is not a program, a training course, or a set of scripts. It's the output of organizational health, culture, employee

engagement, clear policies, well-managed services, and trusting staff to make good decisions.

Why Customer Service Matters in Government IT

Before we discuss how to build service excellence, let's be clear about why it matters specifically for government IT.

The Trust Factor

Government IT operates in a unique context. Unlike private sector companies, citizens can't choose a different provider if they're unhappy with service. They're a captive audience. This makes service quality even more critical, it directly affects public trust in government.

Satisfaction with digital government services consistently trails the private sector by a wide margin, and perceptions of government customer experience are a strong predictor of trust in government overall. When IT provides poor service to internal customers (employees), those employees in turn struggle to serve citizens effectively.

The chain reaction works like this:

- IT provides poor service to Department staff
- Department staff become frustrated and less effective
- Departments provide degraded service to citizens
- Citizens lose trust in government

Your IT customer service quality ripples through the entire organization and directly affects public trust.

The Retention Factor

In small-to-mid-sized local governments, IT staff are hard to recruit and even harder to retain. When internal customers, department heads, managers, and employees, consistently experience poor IT service, they escalate complaints to elected officials and executive leadership. What follows is a toxic cycle:

- Poor service generates complaints
- Complaints undermine IT leadership credibility
- Leadership is weakened and can't advocate effectively for resources
- Lack of resources makes service even worse
- The cycle repeats and intensifies

Good customer service, conversely, builds political capital. When IT consistently delivers excellent service, customers become advocates. They defend your budget requests, they champion your initiatives, and they give you the benefit of the doubt when problems occur.

The Efficiency Factor

Paradoxically, excellent customer service is more efficient than poor service:

First Contact Resolution (FCR), resolving customer issues on the first interaction, is one of the most critical customer service metrics because it simultaneously improves customer satisfaction and operational efficiency. When IT staff are trusted and equipped to fully resolve issues immediately, customers are happy and the team avoids repeated contacts about the same problem.

Poor service, by contrast, generates:

- Repeat contacts for unresolved issues
- Escalations that consume leadership time
- Workarounds that create security and support problems
- Informal "shadow IT" as departments route around IT
- Higher turnover requiring constant training of new staff

Excellent service saves time and money.

The Foundation: Culture and Employee Engagement

Let's return to the core principle that connects everything in this framework:

Unhappy employees do not create happy customers.

According to Gallup's ongoing workplace research, employee engagement in the U.S. fell to a decade-low in 2024, with only 31% of employees engaged, representing 4.8 million fewer engaged employees than the previous year. More concerning, Gallup found that only 46% of employees clearly know what is expected of them, down 10 points from 2020, and only 39% strongly agree that someone at work cares about them, down from 47% in 2020.

These aren't abstract HR statistics, they directly predict customer service quality.

The service culture foundation requires three elements working together:

1. Clear Purpose and Connection

Employees need to understand *why* their work matters, how it connects to the organization's mission and serves the community.

That's where the work becomes operational. When IT staff understand that their work enables departments to serve citizens, that fixing a computer means a permit can be processed, or restoring network access means a sheriff's deputy can do their job safely, service takes on meaning beyond technical tasks.

Your role as leader is to constantly reinforce these connections. In meetings, when discussing projects, when recognizing good work, always connect back to the "why." Help your team see the impact of their service.

2. Psychological Safety and Respect

Customer service empowerment means giving agents autonomy to make decisions, solve problems, and address customer concerns without needing constant managerial approval. This requires equipping them with training, access to data, and real-time support to handle inquiries effectively.

But this trust cannot exist without psychological safety. Staff must believe they can make decisions without being punished for reasonable judgment calls. They need to know that:

- Making a customer-focused decision, even if imperfect, is better than paralysis
- Acknowledging and learning from mistakes is valued
- Taking initiative is encouraged, not penalized
- Leadership will support them when they act in good faith

This connects directly to your organizational culture. The values you establish and reinforce daily create either an environment of fear (where staff hide behind policies to avoid blame) or trust (where staff take ownership of customer problems).

3. Authority Matching Accountability

Remember the principle we've emphasized throughout: **Authority must match accountability.**

If you hold service desk staff accountable for customer satisfaction but don't give them authority to resolve issues, expedite requests, or make other customer-focused decisions, you've created an impossible situation. They'll either become frustrated rule-followers who hide behind policies, or they'll quietly make decisions anyway and face consequences when discovered.

The solution: Clearly define the decision authority that matches each role's customer service accountability. Put it in writing. Communicate it broadly. Then defend your staff when they use that authority appropriately.

Setting the Right Performance Bar

With culture and engagement as your foundation, you now need to define what excellent service means in measurable terms. Key Performance Indicators (KPIs) become essential here, not as punishment tools, but as clarity tools that help everyone understand what success looks like.

The KPIs That Matter for IT Service

Modern customer service research has identified several core metrics that work across industries, including IT. The most effective organizations analyze these KPIs not in isolation, but together to see the complete picture, low Net Promoter Score might link directly to high Customer Effort Score or spikes in Average Handle Time for specific issues. Which ones work best for local government IT:

Customer Satisfaction Score (CSAT)

CSAT measures short-term customer satisfaction with a specific interaction, product, or service, gauging how happy customers are with a particular experience they've just had. For IT, this typically means surveying users immediately after:

- Service desk ticket resolution

- Project delivery
- Training session
- Major system upgrade or migration

CSAT works well for IT because it's:

- Simple to implement (often just one question: "How satisfied were you with the service you received?")
- Easy for customers to respond to quickly
- Specific enough to identify problem areas
- Practical, you can see which services or staff need attention

For small IT teams (under 20 staff), implement CSAT for all major service interactions. The survey can be a simple 5-point scale sent automatically when tickets close. Review results monthly with your team, celebrating high scores and problem-solving low ones.

First Contact Resolution (FCR)

FCR measures how often customer issues are resolved on the first interaction, and organizations that prioritize FCR by giving agents authority to fully address customer needs create superior customer service reputations.

FCR matters enormously for IT service because:

- Customers want their problems solved immediately, not scheduled for multiple callbacks
- Repeat contacts for the same issue are frustrating and time-consuming for everyone
- Low FCR often indicates knowledge gaps, unclear authority, or poor documentation

To improve FCR:

- Build thorough knowledge bases staff can quickly reference
- Give service desk staff authority to make decisions without escalation
- Track FCR by issue type to identify specific areas needing attention
- Use post-interaction surveys confirming issues were truly resolved

For small teams, even simple tracking makes a difference. Don't wait for sophisticated tools, start with a spreadsheet tracking what percentage of tickets are resolved on first contact versus requiring follow-up.

Customer Effort Score (CES)

CES measures how easy or difficult customers find it to resolve an issue or complete an interaction. Rather than focusing solely on satisfaction, CES evaluates the effort customers must invest, directly reflecting their overall experience.

This metric is particularly valuable for IT because:

- High effort (multiple logins, confusing processes, repeated explanations) directly predicts customer dissatisfaction

- Reducing customer effort correlates strongly with higher retention rates and helps identify friction points in the customer experience before they escalate.
- IT can often reduce effort through better self-service tools, clearer documentation, or simpler processes

CES is typically measured with survey questions like: "How easy was it to get your issue resolved?" on a scale of 1–7.

Monitor CES especially for:

- Common request types that should be simple
- Self-service portal interactions
- New system rollouts
- Password reset processes

When you see high effort scores, investigate why. Often you'll discover:

- Processes designed for edge cases that make common tasks complicated
- Security theater that adds friction without real security benefit
- Systems that weren't designed with users in mind
- Lack of integration causing customers to work across multiple disconnected tools

Response and Resolution Time

Average Response Time measures how quickly customers receive an initial response to their inquiry. Companies known for exceptional customer service, like Zappos, prioritize fast response times with targets like under 4 hours for email and under 30 seconds for chat.

For local government IT, realistic targets depend on your team size and service model:

For teams under 10 staff:

- Critical issues (system down, no workaround): Response within 30 minutes
- High priority (significant impact): Response within 4 hours
- Normal priority: Response within 1 business day
- Low priority (enhancement requests): Response within 2 business days

For teams 10–50 staff:

- Critical: Response within 15 minutes
- High: Response within 2 hours
- Normal: Response within 4 hours
- Low: Response within 1 business day

The key word is *response*, not resolution. Let customers know you've received their request, understood it, and when they can expect action. Uncertainty is often worse than waiting.

Net Promoter Score (NPS)

NPS measures customer loyalty and their likelihood to recommend your service, asking "How likely are you to recommend [service] to a colleague?" on a 0–10 scale.

NPS works differently than other metrics because it predicts future behavior rather than measuring past satisfaction. Promoters (scores 9–10) are your champions. Detractors (scores 0–6) are risks.

For IT, use NPS annually or semi-annually to measure overall service perception, not transaction-by-transaction. This gives you a baseline to track improvement over time and helps identify whether service initiatives are working.

KPIs for Performance Management

Here's a critical point about KPIs: They should inform and improve, not punish.

Use KPIs to:

- Identify training needs
- Recognize excellent performance
- Spot systemic problems (if everyone scores low on a metric, it's likely a process problem, not a people problem)
- Make data-driven decisions about resources and priorities
- Celebrate improvement

Do NOT use KPIs to:

- Create ranking systems that pit staff against each other
- Establish arbitrary quotas disconnected from actual service quality
- Punish individual variations when team performance is strong
- Replace judgment with metrics

You're developing people, not managing robots. KPIs provide information to support that development.

The proper use of KPIs creates transparency and shared understanding. When everyone knows what excellent service looks like and can see progress toward it, performance naturally improves.

Leadership Actions: Creating the Environment for Service Excellence

Now that we understand the foundation (culture and engagement) and the measurement (KPIs), let's discuss specific actions you take as an IT leader to create service excellence.

1. Model the Service Mindset

Your team will mirror your approach to service. If you treat internal customers as interruptions, complainers, or obstacles to "real work," your team will too. If you demonstrate genuine service orientation, respect for customers, and commitment to solving problems, that becomes the team norm.

This means:

- Taking customer meetings seriously, never canceling or showing up unprepared
- Responding promptly and thoroughly to questions and concerns
- Following through on commitments without excuses
- Acknowledging when IT could have done better
- Publicly recognizing staff who deliver excellent service

Your actions establish expectations more powerfully than any policy document.

2. Empower Decision-Making

Giving staff authority in customer service means enabling them to take ownership of their roles by making decisions that positively impact both customers and the business, moving from micromanagement to autonomy.

For IT, giving staff authority might include:

- Service desk staff authorized to extend deadlines, waive standard wait times, or prioritize requests based on business impact
- Network administrators who can approve temporary policy exceptions to support urgent business needs
- Application specialists who can create custom reports or minor modifications without change control bureaucracy
- Project managers with budget authority to address issues immediately

Define these authorities clearly. Put them in writing. Then trust your people.

Yes, occasionally someone will make a decision you wish they hadn't. That's the cost of trusting your people, and it's far less expensive than the cost of not trusting them, which is an entire team of people who can't or won't solve customer problems.

3. Remove Barriers to Service

Legacy systems and outdated tools force staff to spend time on workarounds and technical failures rather than equipping them to serve effectively, reducing both speed and quality of service delivery.

Your job includes constantly identifying and removing barriers that prevent your team from serving customers well:

Information Barriers

- Provide thorough knowledge bases that are well-organized and searchable
- Ensure staff have access to necessary customer information without security theater
- Create clear documentation that helps solve problems
- Implement systems that show ticket history, so staff don't ask customers to repeat information

Process Barriers

- Simplify approval processes that don't add real value

- Eliminate redundant data entry
- Remove unnecessary steps in common workflows
- Standardize where it makes sense, but allow flexibility where it doesn't

Tool Barriers

- Invest in quality tools that help staff work efficiently
- Ensure systems integrate so staff aren't jumping between disconnected applications
- Provide mobile options when appropriate
- Keep tools updated and functional

Authority Barriers

- Identify common situations where staff need manager approval but shouldn't
- Push decision-making to the lowest responsible level
- Create clear escalation paths for truly complex situations
- Trust your front-line staff, they often have better customer context than you do

4. Hire and Develop for Service Orientation

Technical skills can be taught. Service orientation is harder to develop.

When hiring, look for candidates who:

- Demonstrate genuine curiosity about understanding problems
- Show empathy and patience in interactions
- Take ownership rather than deflecting or blaming
- Ask clarifying questions instead of making assumptions
- Follow through without being prompted

Then develop these qualities through:

- Onboarding that emphasizes service philosophy, not just technical procedures
- Regular exposure to how IT enables organizational mission
- Opportunities to see services in action with end users
- Recognition that rewards service excellence as highly as technical prowess
- Customer service training appropriate for IT context (not generic scripts, but principles of effective communication, problem-solving, and conflict resolution)

5. Create Feedback Loops

Service excellence requires continuous feedback and adjustment. Build multiple feedback mechanisms:

From Customers to IT

- Post-interaction surveys (CSAT after ticket resolution)
- Quarterly focus groups with department representatives
- Annual full surveys (including NPS)
- Regular meetings with key business partners
- Open channels for complaints and compliments

From IT to Customers

- Monthly service reports showing KPIs and improvements
- Advance notice of planned maintenance with clear business impact statements
- Project updates in plain language
- Quarterly IT updates at staff meetings or via email
- Transparency about challenges and how you're addressing them

Within IT Team

- Weekly team discussions of service metrics
- Monthly review of customer feedback themes
- Celebrations of excellent service examples
- Problem-solving sessions for service issues
- Anonymous team surveys on barriers they face

The goal is a continuous learning cycle that drives improvement, not just collecting feedback.

6. Make Service Excellence Visible and Celebrated

What gets recognized gets repeated. Make service excellence highly visible:

- Spotlight Service Stories: Share examples of excellent service in team meetings. Don't just praise the technician, tell the story of how they helped the customer and what business outcome resulted.
- Public Recognition: Send thank-you emails copying leadership when staff deliver exceptional service
- Metrics Dashboards: Display team KPIs where everyone can see progress
- Customer Testimonials: Share positive feedback publicly
- Service Awards: Create formal recognition for sustained service excellence

When your team sees that service excellence matters as much as technical excellence, they'll invest in both.

Practical Implementation for Different Team Sizes

How you implement these principles varies by team size:

Very Small Teams (1–5 IT Staff)

With limited staff, you can't implement sophisticated measurement systems. Focus on:

- **Personal Connection**: You likely know all your customers personally. Use that to understand satisfaction informally while implementing one simple metric (CSAT surveys on completed tickets).
- **Empowerment**: In small teams, everyone must be empowered to make customer-focused decisions. Create clear guidance about authority, then trust your people.
- **Culture**: With few staff, you can model service excellence directly. Your personal approach sets the entire team's tone.
- **Documentation**: Invest time in simple knowledge base so staff can resolve issues quickly. Use shared folders, wikis, or simple ticketing system notes.

Small Teams (6–20 IT Staff)

At this size, you can implement more structured approaches:

- **Formal KPIs**: Track CSAT, FCR, and response times. Review monthly with team.
- **Service Desk Function**: Designate clear service desk responsibilities even if rotating
- **Knowledge Management**: Invest in knowledge base system and make it part of everyone's job to contribute
- **Team Specialization**: Staff can begin specializing while maintaining general service capability
- **Training Program**: Provide formal customer service training appropriate for IT context

Medium Teams (21–50+ IT Staff)

With more resources, you can be more sophisticated:

- **Full Metrics**: Track full suite of KPIs including NPS annually
- **Dedicated Service Desk**: Formal service desk with career path, not just entry-level rotation
- **Service Catalog**: Published catalog with clear service levels
- **QA Program**: Quality assurance reviews of tickets and customer interactions
- **Specialized Roles**: Customer service manager or service delivery manager role
- **Advanced Tools**: ITSM platform with self-service portal and automated workflows

Regardless of size, the principles remain constant: engaged employees, clear expectations, authority to act, measurement, and continuous improvement.

Your honest answers to these questions reveal where to focus improvement efforts.

Customer service excellence is a culture you build and sustain, not a program you implement. It emerges naturally when employees are engaged, given authority to act, measured appropriately, and supported by systems and processes that enable rather than obstruct service.

Employees who feel trusted to make decisions in their roles are highly engaged in their work, and every one percent increase in employee engagement corresponds to an average three percent increase in revenue growth. This same dynamic drives customer service quality in IT.

Your role as leader is not to personally deliver excellent service (though you should model it). Your role is to create and sustain the environment where your team can and wants to deliver excellent service. That means:

- Building the cultural foundation where service is valued
- Setting clear expectations through appropriate KPIs
- Giving staff authority to make customer-focused decisions
- Removing barriers that prevent great service
- Making service excellence visible and celebrated

Do this well, and customer service excellence becomes self-sustaining, the natural way your organization operates, not a special initiative that requires constant attention. That's when you've succeeded.

How This Connects to the Broader Framework

Customer service excellence doesn't exist in isolation, it's the natural output when other elements of the framework are working well:

Your Module 1 leadership capabilities matter here:

- **Purpose and role clarity** (Section 1.1) helps staff understand why service matters
- **Prioritization** (Section 1.2) makes sure service isn't sacrificed to technical projects
- **Core competencies** (Section 1.3) include service orientation as a leadership standard
- **Handling ambiguity** (Section 1.4) means dealing with the messy reality of customer needs
- **Communication** (Section 1.5) is fundamental to great service interactions

Organizational health (Module 2) makes this possible:

- **Leadership team** (Section 2.1) must be aligned on service standards and model them
- **Vision and purpose** (Section 2.2) connect service to organizational mission
- **Structure** (Section 2.3) should support service delivery, not obstruct it

- **Capabilities** (Section 2.4) include developing service skills alongside technical skills
- **Culture** (Section 2.5) of trust and respect enables service trust
- **Communications** (Section 2.6) create the transparent feedback loops service requires

The strategic work from Module 3 shapes service delivery:

- **Governance** (Section 3.1) provides oversight without micromanagement
- **Strategic planning** (Section 3.2) includes service excellence as strategic objective
- **Frameworks** (Section 3.3) like ITSM structure service delivery
- **Service alignment** (Section 3.4) makes sure you're offering services customers need
- **Budget** (Section 3.5) allocates resources to support service delivery

From Earlier in Module 4:

- **Policies** (Section 4.1) enable service rather than creating obstacles
- **Portfolio and service management** (Section 4.2) clarifies what you're responsible for delivering
- **Knowledge and domain management** (Section 4.3) supports resolving issues quickly

Elsewhere in Module 4:

- **Business relationship management** (Section 4.5) builds on excellent service delivery to create strategic partnerships

Connecting to Module 5:

- Service metrics and feedback drive continuous improvement initiatives
- Service excellence culture encourages staff to identify and implement improvements

That's not a separate initiative. It's how your organization functions when all the pieces work together.

Key Takeaways

- Customer service excellence in government IT isn't a program or training course. It's the output of organizational health, culture, employee engagement, and trusting staff to make good decisions
- The service-trust chain is real: IT serves departments, departments serve citizens. Poor internal IT service degrades the public's experience with government

- Service culture starts with how you treat your own people. Staff who feel trusted, supported, and valued will naturally extend that treatment to the people they serve
- Empowerment beats scripts every time. Give staff principles and judgment authority rather than rigid procedures. Trusted humans who occasionally make different choices than you would deliver far better service than robots following scripts
- Measure what matters, not everything that moves. Three or four core metrics you use to improve service outperform dashboards full of data nobody acts on
- Scale your approach to your reality. A five-person IT shop builds service culture through daily modeling, not formal programs. Adapt the principles to your team size
- Service excellence is not achievable on a poverty budget. Be honest about what's possible with current resources and use that data to advocate for appropriate staffing

Reflection Questions

Consider these questions to evaluate your current state:

1. Do your IT staff view service as interruption or as their primary purpose?
2. When staff make mistakes, is the response "how do we prevent this" or "who do we blame?"
3. Can your service desk staff resolve common issues without managerial approval?
4. When staff use their authority to help customers, do they face consequences or recognition?
5. Can your team articulate what "excellent service" looks like in concrete, measurable terms?
6. What are the top three things that prevent your staff from delivering excellent service, and have you asked them directly?
7. Does excellent service get recognized as highly as technical achievement?
8. Is service excellence part of performance reviews and advancement criteria?

The working documents for this section are in Appendix A.4.4.

Section 4.5

Business Relationship Management

A CIO I know was frustrated. Her IT department delivered projects on time, resolved issues quickly, and kept systems running. Yet department heads consistently viewed IT as a necessary expense rather than a strategic asset. When budget discussions came around, IT requests faced more scrutiny than any other department.

The breakthrough came during an honest conversation with the Finance Director. "Here's the problem," the Finance Director explained. "You're very good at doing what we ask. But we never know what you think we *should* ask for. You respond to our requests, but you don't help us understand what's possible or what we should be prioritizing. We treat IT as a vendor because you act like a vendor."

This stung, but it was accurate. IT had optimized for responsiveness, always saying yes, delivering quickly, minimizing pushback. They thought this was good customer service. What they'd done was train their partners to see IT as an order-taking service rather than a strategic partner.

Business Relationship Management (BRM) is the discipline of building and maintaining strategic partnerships between IT and business partners, moving IT from reactive service provider to partner and trusted advisor.

BRM is, at bottom, communication work. Not communication in the sense of sending emails or attending meetings, but strategic communication, the ongoing dialogue that builds shared understanding, shapes how people think about technology possibilities, and creates the trust foundation for partnership. Everything in this section comes back to communication: how you engage with partners, how you frame technology decisions, how you demonstrate value, how you handle difficult conversations. **If you view BRM as relationship-building separate from your "real work," you've misunderstood the CIO role. Communication IS the work.**

The strategic partnerships that enable IT effectiveness exist because of sustained, skillful communication.

BRM isn't about being friendlier or having more meetings. It's about changing how IT engages with the organization, moving from answering questions to shaping questions, from responding to requests to influencing strategy, from delivering projects to enabling outcomes.

This matters for local government IT because aligning IT and business strategies has proven stubbornly difficult, largely because organizations still default to viewing IT as a utility rather than a strategic partner. Bridging that gap requires active partnerships between CIOs and their executive leadership, with shared focus on innovation, security, resilience, and communicating IT value effectively.

Effective organizations don't just implement isolated IT governance mechanisms, they achieve strategic alignment through commitment to governance principles coupled with strong leadership support and genuine business partnerships. Without strong business relationships, even the best governance structure becomes an empty formality.

Why BRM Is Critical for Local Government IT

Before discussing how to build effective business relationships, let's understand why this matters so much for local government IT.

The Governance Dependency

The uncomfortable truth:

Governance structures fail without strong business relationships.

Consider what happens when governance exists without BRM:

- Governance committees meet but business leaders don't engage seriously
- IT presents recommendations that business leaders don't understand or support
- Decisions get made but aren't implemented because there's no shared commitment
- Business units work around governance rather than through it
- IT becomes isolated, making decisions without real business input

Governance provides the *structure* for alignment. BRM provides the *relationships* that make that structure functional. Achieving strategic alignment between business and IT requires more than governance mechanisms; it requires full commitment to governance principles, supported by genuine partnership and top leadership engagement.

IT governance requires BRM for long-term viability. Without the relationships to:

- Ensure proper business representation and input in governance decisions
- Translate governance decisions into business value leaders understand

- Create shared accountability between IT and business units for outcomes
- Build trust that makes business leaders engage with governance processes

Your governance structure becomes bureaucracy rather than value creation.

The Alignment Challenge

On paper, IT-business alignment looks straightforward. In practice, most CIOs struggle with it. Alignment alone isn't enough anymore. The CIOs delivering real value are finding shared wins with the business, places where IT and the department come out ahead together, not just lining up on a strategic plan.

The challenge is that alignment requires ongoing co-evolution and continuous relationship investment. When BRM is weak:

- Strategic plans don't reflect actual business needs
- Technology investments miss the mark
- Change initiatives face resistance
- IT builds solutions for problems that don't exist or aren't priorities
- Business units pursue shadow IT because they don't trust IT to understand their needs

BRM creates the continuous dialogue that enables real alignment.

The Value Communication Gap

Defining, measuring, and communicating the business value of IT is challenging for many CIOs. What most miss: this isn't primarily a metrics problem, it's a relationship problem.

When IT has strong business relationships:

- Stakeholders understand IT value because they've been part of creating it
- Success stories are told by business leaders, not just IT
- Value is measured in business outcomes, not technical metrics
- Investment decisions are made jointly with clear value expectations
- IT gets credit for enabling business success rather than just "keeping the lights on"

Without these relationships, IT can produce all the metrics in the world and still be seen as a cost center.

The Small Government Reality

In larger organizations, BRM might be a dedicated role or team. But in small-to-mid local governments (populations under 500K), this isn't realistic. Your five-person IT department can't afford a dedicated business relationship manager.

The good news: **BRM is more accessible in local government than most CIOs realize.** You likely know most department heads personally. You see them at meetings, pass them in hallways, serve on committees together. The infrastructure for relationships already exists, you just need to use it strategically.

The challenge isn't access, it's approach. Moving from order-taker to strategic partner requires intentional effort regardless of organization size.

From Order-Taker to Strategic Partner: The Transition

Let's address the behaviors and patterns that keep IT in the order-taker role. Understanding these patterns is the first step toward changing them.

Pattern 1: The Indiscriminate "Yes"

The Pattern: IT leadership believes good service means always saying yes to requests. Department asks for something, IT delivers it. No pushback, no strategic discussion, no context exploration.

Why It Seems Right: We want to be responsive. We want to be seen as helpful. We don't want to be perceived as obstructionist or difficult.

Why It Keeps You in Order-Taker Mode: When you always say yes without discussion, you train people that IT's job is execution, not strategy. They don't bring you into planning because they've learned you just implement whatever they've already decided.

The Strategic Partner Alternative:

Instead of: "Sure, we can build that system for you."

Try: "I want to understand what you're trying to accomplish. Tell me about the business problem you're solving. There might be several ways to approach this, and I want us to choose the approach that best serves your needs and integrates with our overall technology strategy."

It doesn't mean saying no, it means engaging strategically before committing. Sometimes the right answer is still "yes, let's build that." But now you're a partner in the decision, not just an order-taker.

Pattern 2: The Technical Detail Trap

The Pattern: When IT meets with business leaders, conversations focus on technical details, system specs, implementation approaches, technology choices, rather than business outcomes.

Why It Seems Right: We're technical experts. We want to show competence. We assume people want to understand the technology.

Why It Keeps You in Order-Taker Mode: Most business leaders don't care about the technology details. When you lead with technical explanations, their eyes glaze over and they think "IT is smart about technology things I don't understand, but they don't understand my business."

The Strategic Partner Alternative:

Start with business outcomes. What will be different for their department? How will this help them serve citizens better, work more efficiently, or achieve their strategic goals? Technology choices should be a footnote, not the headline.

Learn to translate technical decisions into business language. Not: "We're implementing a VMware infrastructure with automated failover capabilities."

But: "If a server fails, your systems will automatically switch to backup with no downtime. Your staff won't even know something went wrong."

The communication principle here: Translation isn't dumbing things down, it's respecting your audience. These are intelligent people who understand their domains deeply. Your job is making technology decisions comprehensible in their domain language. This translation work is core leadership communication, not optional nicety. **The time you invest in learning to communicate in business terms rather than technical jargon directly determines your effectiveness as a strategic partner.** If people consistently leave meetings with you confused or overwhelmed, the communication failure is yours, not theirs.

Pattern 3: The Passive Engagement

The Pattern: IT waits for departments to come with requests. IT doesn't reach out first to understand business challenges, participate in departmental planning, or offer strategic input unsolicited.

Why It Seems Right: We don't want to be pushy. We want to respect people's time. We wait to be invited.

Why It Keeps You in Order-Taker Mode: If you're not at the table when planning happens, you only see the results of planning, the already-decided requests. By the time IT gets involved, strategic decisions have been made without technology considerations.

The Strategic Partner Alternative:

Create structured touchpoints with each department. Quarterly business reviews where you discuss their upcoming initiatives, challenges, and goals. Not "what do you need from IT?" but "what are you trying to accomplish and how can technology enable that?"

Bring ideas before they ask. "I noticed you're still using spreadsheets for this process. Have you considered automating this? Here's what other departments have done." Show up as an advisor, not just a responder.

Pattern 4: The Project Focus

The Pattern: IT conversations center on projects, specific implementations, timelines, deliverables. Success is defined by completing projects on time and on budget.

Why It Seems Right: Projects are concrete, measurable, and manageable. We're good at project delivery.

Why It Keeps You in Order-Taker Mode: Projects are means, not ends. When IT focuses on project delivery rather than outcome achievement, you're positioned as a vendor completing contracts, not a partner achieving business goals.

The Strategic Partner Alternative:

Frame everything as business outcomes. Not: "We delivered the new permit system on time."

But: "The new system reduced permit processing time from 15 days to 3 days, and the Planning Department processed 40% more permits this quarter with the same staff."

Stay engaged after project completion. How's it working? What business metrics changed? What problems still exist? This demonstrates you care about outcomes, not just deliverables.

Pattern 5: The Information Asymmetry

The Pattern: IT knows a lot about technology but little about business operations. Business leaders know their operations but little about technology capabilities. Neither side invests in understanding the other.

Why It Seems Right: We each focus on our expertise. IT should focus on technology; business should focus on operations.

Why It Keeps You in Order-Taker Mode: Without understanding business operations, IT can't anticipate needs, suggest strategic improvements, or speak credibly about business challenges. You're limited to responding to explicit requests because you lack the context to anticipate.

The Strategic Partner Alternative:

Invest time in understanding each department's operations, challenges, and goals. Shadow employees for a day. Attend department meetings. Read their strategic plans. Ask questions about their work.

Educate business leaders on emerging technology capabilities, not details, but possibilities. "Here's how other counties are using data analytics to predict service demand. Could something like this help you plan better?"

This mutual education creates common ground for strategic conversation.

BRM in Practice: Leadership Actions

Now that we understand what keeps IT in order-taker mode, let's discuss specific actions IT leaders take to build strategic business relationships. Remember, in small teams (5–25 people), BRM is everyone's job, not a dedicated role:

- **The CIO** primarily handles BRM with executive leadership and department heads
- **Technical leads/managers** carry BRM responsibilities for their domains and specialties
- **Everyone** contributes to relationship building through their daily interactions

1. Create Structured Engagement Mechanisms

Strategic relationships don't happen accidentally, they require structure. Establish regular touchpoints with business leaders:

Quarterly Business Reviews (QBRs)

Schedule 60-minute quarterly meetings with each department head (or major business unit). The agenda is theirs, not yours:

- What are your strategic priorities for the next 6–12 months?
- What operational challenges are you facing?
- How is technology helping or hindering your work?
- What opportunities do you see that technology might enable?

Document these conversations. Look for patterns across departments. Use this information to shape IT strategy.

IT Governance Committee Meetings

Regular governance meetings with business representation. But don't let these become rubber-stamp sessions. Use them for genuine strategic discussion:

- Portfolio reviews (what should we start, stop, continue?)
- Resource allocation decisions
- Technology direction setting
- Risk and security discussions

Prepare materials that enable strategic discussion, not just status updates.

Informal Connections

Don't underestimate informal relationship building. Coffee meetings, lunch conversations, hallway discussions, these create the trust and rapport that make formal governance work.

In small organizations, you probably already have these informal connections. Use them strategically. When you run into the Finance Director at lunch, don't just chat about the weather, ask about upcoming budget planning, mention a technology trend you're watching, share a success story from another department.

2. Speak Business Language, Not IT Language

This is important and requires practice. Train yourself and your team to translate technical concepts into business terms:

Bad BRM Communication: "We need to implement a SIEM solution for enhanced log aggregation and correlation to improve our security posture and meet compliance requirements."

Good BRM Communication: "We need to invest in security monitoring that helps us detect and respond to cyber threats faster. Right now, if someone's trying to break into our systems, we might not know for hours or days. This investment would alert us within minutes, significantly reducing the potential damage from a cyber attack."

Notice the difference:

- Focus on outcomes, not tools
- Use concrete examples, not abstractions
- Connect to things leaders care about (risk, service quality, efficiency)
- Avoid acronyms and jargon

Make this a discipline. Before any business meeting, ask yourself: "If I had to explain this to someone with zero IT knowledge, how would I say it?"

3. Demonstrate Business Acumen

Strategic partners understand the business they're supporting. Invest in developing business acumen:

Learn How Government Works

- Understand budget cycles and processes
- Learn about regulatory requirements affecting different departments
- Know who reports to whom and what each department's mandate is
- Understand elected officials' priorities and how they affect operations

Understand Department Operations

- What are their key performance indicators?
- What processes are their biggest pain points?
- What external pressures do they face (regulations, citizen expectations, mandates)?
- What makes a good day versus a bad day for them?

Speak to Organizational Priorities When proposing technology investments, connect explicitly to organizational priorities:

Not: "We need to upgrade our network infrastructure."

But: "The City Council's priority is improving public safety response times. Our current network infrastructure limits our ability to support the real-time data sharing between dispatch, police, and fire that would significantly reduce response times. This infrastructure investment directly enables that strategic priority."

4. Bring Input Before You're Asked

Don't wait to be asked. Offer strategic input when you see opportunities:

Example 1: Anticipatory Advice

You hear from the Finance Director that the City Manager wants to implement performance dashboards for all departments. Before anyone formally asks IT, reach out first:

"I heard about the dashboard initiative. I'd like to understand what outcomes you're hoping for so IT can ensure our data systems support this well. I've also seen some approaches that work better than others, and I'd be happy to share what I've learned from other jurisdictions."

You've now positioned yourself as a strategic advisor, not an order-taker waiting for specifications.

Example 2: Strategic Technology Briefings

Quarterly, prepare brief updates on technology trends relevant to your organization. Not "here's cool technology," but "here's how this technology trend might affect our ability to serve citizens or operate efficiently."

This demonstrates you're thinking strategically about how technology evolution affects organizational capability.

Example 3: Cross-Departmental Opportunities

When you notice multiple departments solving similar problems in different ways, bring them together:

"I've noticed three departments are all building citizen notification systems separately. What if we implemented an enterprise solution that serves all three? You'd get better functionality, we'd be more efficient, and citizens would have a consistent experience."

This shows you're thinking about organizational optimization, not just individual department requests.

5. Build Shared Accountability for Outcomes

BRM connects most directly to governance here. Strategic partners share accountability for outcomes, not just IT deliverables.

Joint Success Criteria

When starting any significant initiative, establish success criteria jointly with business partners:

IT might measure: system uptime, performance, adoption rates Business measures: efficiency gains, cost savings, service quality improvements, citizen satisfaction

Both parties commit to both sets of metrics. IT owns the technical success; business owns the outcome success; both share accountability for the overall result.

Post-Implementation Reviews

Three to six months after major implementations, conduct formal reviews with business partners:

- Did we achieve the business outcomes we expected?
- What worked well? What didn't?
- What additional opportunities does this create?
- What should we do differently next time?

These reviews demonstrate IT's commitment to outcomes, not just delivery. They also create opportunities to identify follow-on improvements.

Transparent Performance Communication

Share IT performance metrics with business partners regularly, but frame them in business context:

Not: "Our ticket resolution time is 2.3 days on average."

But: "Our service desk resolved 94% of requests within our target timeframes this quarter, ensuring minimal disruption to your operations. The 6% that exceeded targets were primarily complex issues requiring vendor assistance, we're working on solutions to reduce those delays."

6. Manage Up and Across, Not Just Down

Effective BRM requires influence across the organization. In smaller governments, IT leaders must develop peer relationships with other department heads and strong relationships with executive leadership.

With Department Head Peers:

Position yourself as a peer helping peers succeed, not a subordinate service provider. When in leadership team meetings:

- Contribute to non-IT discussions when you have relevant insights
- Support colleagues' initiatives publicly
- Offer to help solve problems outside IT's traditional scope
- Build social capital through genuine collegiality

With Executive Leadership:

Help executives understand IT's strategic value through consistent, strategic communication:

- Brief them before governance meetings so there are no surprises
- Bring them solutions, not just problems
- Frame IT contributions in terms of their priorities
- Make them look good by making their priorities successful

With Elected Officials:

In local government, elected officials ultimately control resources and priorities. While the CIO typically doesn't interact with them daily, create opportunities to demonstrate IT value:

- Offer technology briefings on relevant topics (cybersecurity, digital service delivery)
- Provide clear, concise updates on major initiatives
- Help them understand technology's role in achieving their policy priorities
- Ensure they hear about IT successes, not just problems

7. Invest in Your Team's BRM Capabilities

Remember, in IT teams, everyone contributes to business relationships. Your network administrator might be the person who best understands Public Works'

operations. Your application specialist probably has the deepest relationship with Finance.

Develop BRM skills across your team:

Model Strategic Thinking

In team meetings, consistently frame work in business terms:

- Not: "We need to patch the Exchange server."
- But: "We need to patch the email system to prevent a vulnerability that could allow cyber attackers to access sensitive city communications."

Your team will learn to think and communicate this way.

Encourage Cross-Functional Learning

Send team members to department meetings, planning sessions, and operational reviews. The more your team understands business operations, the better they can be strategic partners.

Recognize Relationship Building

When team members show good business relationship skills, explaining something well to a non-technical person, solving a business problem before being asked, building trust with partners, recognize it publicly. This reinforces that technical excellence and relationship excellence are equally valued.

Provide Training

Not everyone naturally has strong interpersonal skills. Provide training on:

- Business communication
- Active listening
- Facilitation and meeting management
- Conflict resolution and negotiation
- Strategic thinking and systems thinking

These skills are as important as technical training for effective BRM.

Success Indicators: Knowing BRM Is Working

How do you know when you've successfully transitioned from order-taker to strategic partner? Here are tangible indicators:

Indicator 1: Early Involvement

What to watch for:

- Department heads involve IT in planning conversations before decisions are made
- You're invited to strategic planning sessions, not just asked to implement results

- Stakeholders say "let me check with IT" during early discussions, not after everything's decided
- Business cases for new initiatives include IT input from the beginning

Why it matters: Being at the table when strategy is formed is the clearest sign you're seen as a strategic partner, not just an implementation resource.

Indicator 2: Shifted Request Patterns

What to watch for:

- Fewer emergency "we need this yesterday" requests
- More strategic project requests with adequate lead time
- Requests come with business context, not just technical specifications
- Stakeholders bring you into conversations earlier, asking for your perspective before decisions are made

Why it matters: Request patterns reveal how stakeholders view IT's role. Strategic partners are consulted early; order-takers are handed emergency tasks.

Indicator 3: Meeting Invitations

What to watch for:

- IT gets invited to department leadership meetings
- You're asked to join strategic initiative teams, not just project implementation teams
- Stakeholders want IT present for planning discussions, not just status updates
- Department heads seek IT input on budget planning early in the process

Why it matters: Who gets invited to which meetings reveals who's seen as strategic versus tactical.

Indicator 4: Advocacy, Not Adversary

What to watch for:

- Departments advocate for IT budget rather than questioning it
- Business leaders defend IT timelines and resource needs
- Stakeholders speak positively about IT value to elected officials and executive leadership
- When things break, stakeholders troubleshoot alongside IT rather than pointing fingers

Why it matters: Strategic partners are advocates for each other. Order-takers get blamed when things go wrong and ignored when things go right.

Indicator 5: Bidirectional Information Flow

What to watch for:

- Business leaders share information with IT about upcoming changes early
- IT learns about major initiatives from stakeholders, not gossip
- Stakeholders ask IT about technology trends and implications
- Information flows naturally in both directions without formal processes forcing it

Why it matters: Information sharing is a trust indicator. People share information with strategic partners; they withhold it from vendors.

Indicator 6: Joint Problem-Solving

What to watch for:

- When challenges arise, stakeholders engage IT in solution design, not just problem reporting
- Business and IT collaborate to solve problems creatively
- Stakeholders ask "how can we…" instead of "why can't you…"
- **Failures are treated as learning opportunities, not blame exercises**

Why it matters: Strategic partners solve problems together. Order-taker relationships are transactional, IT either delivers or doesn't.

Indicator 7: Strategic Outcomes, Not Just Deliverables

What to watch for:

- Success celebrations focus on business outcomes, not just project completion
- IT's contributions are measured in business results, not just technical metrics
- Stakeholders can articulate the business value IT delivers
- IT is credited for enabling strategic initiatives, not just "keeping systems running"

Why it matters: How success is defined and credited reveals the nature of the relationship.

Indicator 8: Genuine Governance Engagement

What to watch for:

- Governance committee meetings involve real strategic discussion, not rubber-stamping
- Business leaders come prepared and actively participate
- Governance decisions are implemented, not just documented
- Business and IT share accountability for governance outcomes

Why it matters: As we discussed earlier, governance only works with strong business relationships. Active, genuine governance engagement is both an indicator and enabler of strategic partnership.

Practical Implementation for Different Team Sizes

The principles of BRM remain constant across team sizes, but implementation varies:

Very Small Teams (1–5 IT Staff)

With limited staff, BRM is primarily the IT leader's responsibility:

Focus Areas:

- **CIO/IT Director** builds relationships with all department heads and executive leadership personally
- **Technical staff** build strong relationships with their primary customer groups
- **Formal structures** are minimal, rely on informal touchpoints and scheduled one-on-ones
- **Communication** is direct and personal rather than through formal channels

Key Actions:

- Schedule monthly coffee/lunch with different department heads on rotating basis
- Attend department head meetings when invited
- Make yourself visible and accessible
- Share brief monthly IT updates via email highlighting business value

Small Teams (6–20 IT Staff)

At this size, BRM can be more structured:

Focus Areas:

- **CIO** maintains relationships with executive leadership and department heads
- **Technical leads** are assigned relationship responsibility for specific departments or functions
- **Formal structures** include quarterly business reviews and regular governance meetings
- **Team approach** to major stakeholder relationships

Key Actions:

- Implement quarterly business reviews with major departments
- Assign relationship "ownership" for each department to specific IT staff
- Create one-page IT newsletter quarterly highlighting business value and upcoming initiatives
- Establish IT governance committee with business representation
- Conduct annual stakeholder satisfaction surveys

Medium Teams (21–50+ IT Staff)

With more resources, BRM can be more sophisticated:

Focus Areas:

- **Possible dedicated BRM role** or leadership team member with BRM as primary responsibility
- **Account management model** where IT staff are assigned to support specific departments
- **Formal relationship metrics** tracked and reported
- **Structured communication plans** for different audience groups

Key Actions:

- Consider dedicated Business Relationship Manager position
- Implement account management approach with clear responsibilities
- Develop formal communication strategy for different audience groups
- Create executive dashboard showing IT value and contribution to business outcomes
- Conduct formal relationship assessments and maturity models
- Establish user advisory groups for major systems and services

Regardless of size, the core principle remains: **BRM is about building genuine partnerships where IT and business share accountability for organizational success.**

Communication Skills That Enable BRM

While this entire section has emphasized that BRM is communication work, let's be explicit about the specific communication capabilities that enable strategic partnership.

Active listening beyond the surface request

When a department head asks for a specific technology solution, what are they really asking for? What business problem are they trying to solve? What outcomes do they need? Active listening means hearing not just the request but the need behind it.

The work requires:

- Asking questions before proposing solutions
- Listening for business context, not just technical requirements
- Understanding the pressure points and constraints stakeholders face
- Hearing what's unsaid, the concerns they're not articulating

The practice: When someone brings you a request, discipline yourself to ask three "why" questions before discussing solutions. "Help me understand what's driving this need." "What happens if we don't address this?" "What does success look like from your perspective?"

Framing technology in business impact terms

Everything you do should be translated into business value language. Every project. Every investment. Every decision.

Not: "We're upgrading to a new email platform with better security features and improved collaboration tools."

But: "We're addressing the top security vulnerability in our environment while giving your staff better tools to work remotely and collaborate with external partners, capabilities you've told us you need for the economic development initiative."

The practice: Before any business communication, ask yourself: "If I were them, why would I care about this?" Lead with that answer.

Managing difficult conversations skillfully

BRM requires handling difficult conversations regularly:

- Saying no to requests that don't align with priorities
- Explaining why projects are delayed or over budget
- Addressing stakeholder dissatisfaction with service
- Challenging stakeholder assumptions about technology

Your ability to handle these conversations without damaging relationships determines whether you can be a strategic partner or remain an order-taker afraid to disappoint.

The practice: Use the "Acknowledge-Explain-Propose" framework for difficult conversations:

1. **Acknowledge** the stakeholder's concern or request legitimately ("I understand why this matters to your department")

2. **Explain** the constraints or context ("Here's what we're balancing…")

3. **Propose** a path forward that addresses their core need ("Here's what we can do…")

Building narrative that demonstrates value

Strategic partners tell stories about value created, not just services delivered. When your CFO asks what IT accomplished this quarter, you need a compelling narrative, not a status report.

"We completed 15 projects" is a status report.

"We reduced permit processing time from 6 weeks to 2 weeks, which Planning tells us helped land two major development projects that will create 200 jobs" is a value narrative.

The practice: Collect and share success stories regularly. Interview business leaders about how IT initiatives helped them achieve their goals. Make these stories visible across the organization.

Consistent touchpoint communication

Strategic relationships require regular communication, not just when you need something or something goes wrong.

The practice: Establish quarterly business reviews with each major business partner. Not project status meetings, strategic conversations about their goals, challenges, and how technology can help. Maintain this rhythm even when there's no immediate project or issue. These consistent touchpoints build the relationship foundation that sustains strategic partnership.

Remember the core principle: These communication skills aren't "soft skills" that supplement your technical expertise. **They are the skills that determine whether your technical expertise creates organizational value.** The best technical solution poorly communicated creates no value. An adequate technical solution skillfully communicated and in step with business needs creates enormous value.

Your communication capability directly determines your leadership effectiveness. Invest in developing it accordingly.

Your honest answers reveal your BRM maturity and where to focus improvement efforts.

Business Relationship Management separates IT as a cost center from IT as a strategic asset. It determines whether you're responding to requests or shaping strategy, whether you're an order-taker or a valued partner.

This doesn't happen through a program or initiative, it happens through consistent, strategic relationship building over time. It requires:

- Changing patterns that keep IT in order-taker mode
- Creating structured engagement mechanisms while building genuine connections
- Speaking business language and demonstrating business acumen
- Bringing strategic input before being asked rather than waiting
- Building shared accountability for outcomes, not just deliverables
- Developing BRM capability across your entire team

Above all, it requires recognizing that strong business relationships make everything else work. Without them:

- Governance becomes bureaucracy
- Strategy misses the mark
- Service excellence isn't valued
- Improvement initiatives lack support

With strong business relationships:

- Governance drives real alignment
- Strategy reflects actual business needs
- Service excellence is recognized and resourced
- IT becomes integral to organizational success

Successful IT leaders already know this from experience: strategic connection between business and IT isn't achieved through governance mechanisms alone, it requires genuine commitment to partnership principles, supported by strong leadership engagement and authentic business relationships.

Your job as IT leader is to build and sustain these relationships, making them the foundation upon which all of IT's work rests. Do this well, and IT transforms from a necessary expense into a strategic advantage.

How This Connects to the Broader Framework

Business Relationship Management is where IT's internal work meets the organization's real needs. Without strong relationships, even excellent governance and capable teams produce services nobody asked for:

This builds directly on Module 1 leadership skills:

- **Purpose and role** (Section 1.1) BRM helps you live out IT's purpose as enabler of organizational mission
- **Prioritization** (Section 1.2) Strong business relationships inform what IT should prioritize
- **Core competencies** (Section 1.3) Communication, influence, and strategic thinking enable BRM
- **Handling ambiguity** (Section 1.4) Business relationships help manage political and organizational complexity
- **Communication** (Section 1.5) Effective communication is the basis of all business relationships

Module 2's organizational health work supports this:

- **Leadership team** (Section 2.1) Your IT leadership team must model strategic partnership behavior
- **Vision and purpose** (Section 2.2) Shared understanding of organizational direction enables alignment
- **Structure** (Section 2.3) Clear roles and relationships support effective BRM
- **Capabilities** (Section 2.4) Developing business acumen in IT staff enables partnership
- **Culture** (Section 2.5) Culture of collaboration and trust makes BRM possible
- **Communications** (Section 2.6) Effective organizational communication supports relationship building

Strategic alignment from Module 3 drives the substance:

- **IT Governance** (Section 3.1) BRM makes governance functional and sustainable, governance provides structure, BRM provides relationships

- **Strategic planning** (Section 3.2) Business relationships ensure IT strategy aligns with organizational strategy
- **Frameworks** (Section 3.3) BRM helps translate frameworks into business value
- **Service alignment** (Section 3.4) Strong relationships ensure IT offers services that matter
- **Budget** (Section 3.5) Business partnerships make IT budget advocacy effective

From Earlier in Module 4:

- **Policies** (Section 4.1) Business relationships help create policies that enable rather than obstruct
- **Portfolio management** (Section 4.2) BRM makes sure portfolio decisions reflect real business priorities
- **Knowledge management** (Section 4.3) Relationships enable knowledge sharing across IT and business
- **Customer service** (Section 4.4) Strategic partnerships create environment where service excellence thrives

And toward Module 5:

- BRM creates the feedback loops and shared learning that drive improvement
- Strong relationships enable honest discussion about what's working and what isn't
- Business partnerships provide resources and support for improvement initiatives

BRM is how strategic IT leadership operates, not a separate initiative. It's the difference between IT as a utility that keeps systems running and IT as a strategic partner that enables organizational success.

Key Takeaways

- The difference between IT as a cost center and IT as a strategic partner comes down to the quality of your business relationships, not the quality of your technology
- Business relationship management is a team capability, not a CIO-only responsibility. Your network administrator needs relationship skills as much as you do
- Moving from order-taker to strategic partner requires speaking the business language, understanding departmental challenges, and demonstrating how technology enables their mission
- Trust is built through honest conversations about constraints and trade-offs. Over-promising to be liked destroys more relationships than delivering hard truths

- Relationships must operate within governance, not around it. When informal deals bypass governance structures, you undermine the very systems that protect everyone
- Invest intentionally in relationships with skeptics and critics. These difficult partners often have the most legitimate concerns and, once addressed, become your strongest advocates
- Measure relationship outcomes, not activities. Being invited to strategic planning, seeing request patterns change, and hearing departments advocate for IT budget are better indicators than counting meetings attended

Reflection Questions

Consider these questions to evaluate your current business relationship effectiveness:

1. When do business leaders typically involve IT in initiatives, at the beginning, middle, or end of planning?
2. When was the last time a business leader asked IT's opinion on something not explicitly IT-related?
3. Do department heads see you as peer, advisor, or service provider?
4. When business leaders talk about IT in your absence, what do they say?
5. When budget discussions occur, who advocates for IT, just you, or business leaders too?
6. Does your governance structure influence decisions or just document them?
7. Can your technical staff explain their work in business terms?
8. Is relationship building recognized and rewarded as much as technical excellence?

The working documents for this section are in Appendix A.4.5.

Module 4: Summary

Delivering Great Service: Where the Framework Meets Your Customers

Every CIO I know can point to a moment where they realized the gap between what IT was doing and what people experienced. Maybe it was a department head saying, "Your team is technically talented but impossible to work with." Maybe it was discovering that a policy designed for consistency was driving customers to work around IT entirely. The technical work might be excellent. The service experience wasn't.

Module 4 is about closing that gap. Service excellence doesn't come from mandates, training programs, or "customer service initiatives." It emerges when the right conditions are in place: engaged employees, enabling policies, clear service definitions, shared knowledge, and genuine partnerships with the people you serve. Skip any one of those conditions and you'll keep chasing service quality without catching it.

The five sections of this module built a framework for service excellence:

Section 4.1: Policies and Procedures tackled the policy paradox head-on. Organizations need policies for consistency and compliance, but too many policies, or poorly designed ones, destroy the very service quality they're supposed to protect. Less is more. The best organizations trust their people's judgment within clear principles rather than scripting every situation.

Section 4.2: Portfolio and Service Management provided the discipline of managing everything IT delivers, services, applications, infrastructure, and projects, as an interconnected portfolio of investments. When you see the whole picture, you can make strategic decisions about what to start, stop, continue, and change. Creating a service ownership culture where people take entrepreneurial responsibility for their services transforms how IT delivers value.

Section 4.3: Knowledge and Domain Management addressed how to capture, organize, and share knowledge while building deep domain expertise. Knowledge management isn't primarily about documentation systems. It's about creating cultures where sharing is valued and rewarded, and where domain ownership provides the accountability that makes services work at scale.

Section 4.4: Customer Service established that service excellence starts with your people, not your processes. Unhappy employees don't create happy customers. The right KPIs provide clarity rather than punishment. Leaders create service excellence by removing barriers, enabling decisions, and making great service visible and celebrated.

Section 4.5: Business Relationship Management showed how to move IT from order-taker to strategic partner. Governance needs BRM to be sustainable. Moving from order-taker to partner requires changing specific patterns. And strong

business relationships make every other aspect of IT leadership easier, from budget advocacy to governance to strategic alignment.

The Service Excellence Equation

Throughout Module 4, a consistent theme emerged: **Service excellence is the output when earlier elements work together, not something you can build directly.**

Think of it as an equation:

Service Excellence = (Engaged Employees x Clear Direction x Proper Tools) + (Strong Relationships x Enabling Policies)

You cannot mandate any single component and expect great service. But when all components are present and reinforcing:

- Engaged employees (Module 2) care about service quality
- Clear direction (Module 3) ensures effort focuses on what matters
- Proper tools and knowledge (Module 4, Sections 4.2 and 4.3) enable effective service delivery
- Strong relationships (Module 4, Section 4.5) ensure service aligns with needs
- Enabling policies (Module 4, Section 4.1) empower rather than constrain

Service excellence becomes natural, the default state rather than the exception.

How Module 4 Connects to the Full Framework

Module 4 is where the strategic work of Modules 1–3 becomes operational:

Module 1 (Being a Government IT Leader) feeds directly into service delivery. Your personal leadership competencies, purpose clarity, time prioritization, self-awareness, political navigation, and communication, directly affect your ability to create service excellence. Leaders who see IT as a technical function create technically competent departments. Leaders who see IT as service organization create strategically valued partners.

Module 2 (Building a Healthy Organization) created the conditions for this work. The organizational health you built, strong leadership team, compelling vision, effective structure, capable people, healthy culture, and strong communications, is where service excellence can flourish. Without engaged employees working within healthy culture, no amount of policies, processes, or training will create great service.

Module 3 (Working on the Right Stuff) keeps service focused on mission. The governance, strategic planning, frameworks, service alignment, and budget discipline you established confirm that service excellence efforts focus on what matters to organizational mission. Service excellence that advances the wrong priorities is wasted effort.

Looking ahead to Module 5 (Continuously Improving): service excellence creates the feedback loops, stakeholder engagement, and organizational capability that enable continuous improvement. When service is excellent, partners provide honest feedback. When employees are engaged, they identify improvements. When relationships are strong, changes can be implemented collaboratively. Module 5 builds on this groundwork to create lasting organizational evolution.

Final Thoughts

Service excellence is achievable. Not easy, it requires cultural transformation, ongoing effort, and leadership commitment. But achievable.

The five sections of Module 4 provided frameworks, practices, and guidance. But frameworks don't create service excellence, leaders do, by:

- Building cultures where service is valued (2.5)
- Removing barriers that prevent great service (4.1, 4.2, 4.3)
- Enabling employees to serve customers well (4.4)
- Creating strategic partnerships with stakeholders (4.5)
- Modeling service orientation personally and consistently

You've now completed four of five modules in the HPG-IT Framework:

- **Module 1:** Being a Government IT Leader, the personal competencies that enable effectiveness
- **Module 2:** Building a Healthy Organization, the team, structure, and culture where people do their best work
- **Module 3:** Working on the Right Stuff, the governance, planning, and frameworks that make sure you're working on right things
- **Module 4:** Delivering Great Service, the practices that translate foundation into consistent value delivery

Each module built on the one before it: leadership competencies made organizational health possible, which made strategic alignment stick, which made service excellence achievable.

Module 5: Continuously Improving completes the approach by showing how to create the feedback loops, learning culture, and systematic practices that ensure your organization continues to evolve, adapt, and improve long after you've completed initial implementation.

Service excellence is the foundation for continuous improvement, not a destination. Organizations that deliver great service have the stakeholder trust, employee engagement, and operational capability required for ongoing evolution.

The work continues. But you're no longer building blind. You have clarity, frameworks, and proven practices for creating service excellence.

Use them well. Your organization, your team, and the citizens you serve are counting on you.

The working documents for this module are in Appendix A.4.M.

MODULE 5

CONTINUOUSLY IMPROVING

Introduction to Module 5

An IT director I worked with completed implementation of an IT framework over three years. The journey was intense, establishing governance, building strategic plans, implementing service management, developing his team, creating policies and procedures. By year three, the organization had transformed. Services were documented. Processes worked. Governance functioned. People were engaged. Metrics showed improvement.

Then he made a critical mistake: he declared victory.

"We've done it," he announced at an all-staff meeting. "We've built a high-performing IT organization. We have the frameworks in place. Now we just need to execute."

Eighteen months later, the organization was struggling. Not catastrophically, services still delivered, systems still ran. But the energy was gone. Innovation had stopped. Problems that should have been addressed festered. Staff engagement dropped. Customer satisfaction plateaued, then declined slightly. The frameworks remained, but the vitality had evaporated.

What happened?

The organization had mistaken reaching a destination for beginning a journey. They'd built frameworks, then stopped improving. They'd achieved real capability and then stopped questioning whether their practices still made sense.

The lesson was painful but clear: **There is no "done" in organizational development. There is only continuous improvement, or decline.**

Organizations are living systems. Technologies change, business needs shift, new challenges emerge, and competitive pressures don't wait. Standing still means falling behind, change continues whether you participate or not.

Implementing frameworks wasn't the finish line, it was the starting line. Continuous learning, adaptation, improvement. Building systems that generate ongoing development instead of requiring heroic periodic overhauls.

That's what Module 5 is about: building sustainable continuous improvement capability into organizational DNA.

The Challenge: Why Continuous Improvement Is Hard

If the cost of standing still is this clear, why don't all organizations build continuous improvement capability?

Because it's difficult:

Operational Demands Consume Capacity

Daily operational work creates constant pressure. Tickets need answering. Incidents need resolving. Projects need delivering. Improvement gets deferred: "We'll work on that when things calm down."

Things never calm down. Without explicit systems protecting improvement time, operations always wins.

Cultural Resistance to Change

"We've always done it this way" is a powerful force. People find comfort in known approaches even when better alternatives exist. Change is uncomfortable. Status quo is comfortable.

Continuous improvement requires cultural acceptance that current state is never good enough, because there's always a better version ahead.

Short-Term Focus vs. Long-Term Investment

Improvement requires investment, time, resources, focus, with payoff later. Operational delivery provides immediate visible results. Political and budget pressures create bias toward short-term delivery over long-term capability building.

Organizations get rewarded for putting out fires, not for preventing them. The result is a vicious cycle, lack of improvement breeds more fires requiring more firefighting.

Measurement Challenges

Improvement impact can be difficult to quantify. How do you measure "better culture"? How do you prove that process improvement prevented problems that didn't happen? How do you value learning from failed experiments?

Without clear metrics, improvement struggles for resources against operational work with obvious metrics.

Leadership Continuity Issues

Leadership changes disrupt improvement momentum. New leaders want to "make their mark" with new initiatives rather than sustaining previous improvements. Continuous improvement requires consistency over time, but leadership turnover creates discontinuity.

Risk Aversion in Public Sector

Government culture often penalizes failure more than it rewards innovation. You end up with conservative environments where "don't make things worse" trumps "make things better."

Improvement involves experimentation, which involves risk of failure. Risk-averse cultures struggle with this.

The Knowing-Doing Gap

Most organizations know improvement matters. Leaders understand its importance. Staff recognize need. But knowing and doing are different.

The gap between understanding continuous improvement principles and implementing them consistently is where most organizations fail. Good intentions meet operational reality, and improvement loses.

Module 5 Overview: The Five Sections

Module 5 provides integrated framework for building sustainable continuous improvement capability. The five sections work together:

Section 5.1: Feedback and Engagement

Continuous improvement starts with culture that values feedback and engages employees. Section 5.1 establishes:

- The 20% principle: protecting time for improvement work
- Feedback mechanisms that surface improvement opportunities
- Psychological safety enabling experimentation
- Employee engagement that makes people want to improve
- Systems that capture and respond to feedback

This section builds the cultural foundation. Without engaged employees who feel safe and have protected time for improvement, nothing else in the module works.

Section 5.2: Organizational Integration

Building on that cultural foundation, Section 5.2 addresses how IT leaders integrate technology governance into the broader organization:

- Embedding IT into organizational decision-making processes
- Building governance structures that departments follow
- Creating integration points that connect IT strategy to organizational operations

Section 5.3: Making Things Better

With culture established, Section 5.3 addresses leadership's role in creating environment where improvement happens:

- How leaders identify improvement opportunities
- How to prioritize among competing improvements
- Creating entrepreneurial culture where people take ownership
- Removing obstacles preventing improvement
- Establishing intake and evaluation frameworks
- Authority matching accountability for improvement

This section focuses on leadership actions that enable improvement throughout organization.

Section 5.4: Performance Management for Continuous Improvement

Section 5.4 helps ensure improvement work is tracked, measured, and valued:

- Reframing performance management from evaluation to development
- Goal frameworks (OKRs) aligning individual to organizational improvement
- Measuring organizational maturity, not just operational efficiency
- Regular 1:1 meetings as continuous feedback mechanism
- Tracking improvement initiatives through performance management systems
- Celebrating improvement attempts, not just successes

This section provides accountability infrastructure so improvement happens consistently.

Section 5.5: Innovation Leadership

Innovation is specialized form of continuous improvement, applying breakthrough thinking to create breakthrough change. Section 5.5 addresses:

- Why everyone must innovate (not separate innovation teams)
- IT's dual innovation role: internal + enabling departmental innovation
- Innovation vs. continuous improvement (distinct but overlapping)
- Approach to managing innovation intake, evaluation, implementation
- Making innovation sustainable rather than episodic

- Learning from innovation failures

This section completes the framework by showing how to systematically generate and manage both incremental improvements and breakthrough innovations.

How These Sections Work Together

The sections aren't independent. They're an integrated system:

Section 5.1 creates the culture where improvement is valued, people are engaged, and psychological safety enables experimentation. Without this groundwork, improvement efforts become bureaucratic compliance rather than real development.

Section 5.2 embeds improvement governance into the organization's existing decision-making processes, making IT oversight a natural part of budget cycles, board agendas, and procurement workflows rather than a separate compliance exercise.

Section 5.3 provides leadership framework for identifying opportunities, enabling action, removing obstacles, and establishing systems. This translates cultural foundation into practical mechanisms.

Section 5.4 creates accountability through performance management, so improvement work happens consistently and is tracked, measured, and celebrated.

Section 5.5 extends to innovation, showing how to manage breakthrough changes alongside incremental improvements.

These sections work as a system: culture, leadership, accountability, and innovation reinforcing each other to build lasting improvement capability.

How Module 5 Integrates With Previous Modules

Continuous improvement doesn't stand alone. It integrates with and depends on the groundwork built in Modules 1–4:

Module 1: Being a Government IT Leader provides personal competencies essential for continuous improvement:

- Time management (Section 1.2) creates space for improvement amid operational demands
- Self-awareness (Section 1.3) enables leaders to model continuous learning
- Political navigation (Section 1.4) builds support for improvement initiatives
- Communication (Section 1.5) enables feedback loops and improvement conversations

Leaders without Module 1 competencies struggle to sustain continuous improvement against operational pressures.

Module 2: Building a Healthy Organization establishes cultural foundation continuous improvement requires:

- Vision (Section 2.2) provides direction for improvement, what are we improving toward?
- Structure (Section 2.3) creates accountability for improvement
- Capabilities (Section 2.4) build skills needed for improvement
- Culture (Section 2.5) determines whether improvement is valued or resisted
- Communications (Section 2.6) provide channels for improvement feedback

Unhealthy organizational culture kills continuous improvement. Module 2 health enables Module 5 improvement.

Module 3: Working on the Right Stuff keeps improvement focused on what matters:

- Governance (Section 3.1) prioritizes improvement initiatives strategically
- Strategic planning (Section 3.2) identifies capability gaps needing improvement
- Frameworks (Section 3.3) provide standards guiding improvement
- Service alignment (Section 3.4) makes sure improvements address business needs

Without strategic alignment, improvement becomes random activity disconnected from organizational priorities.

Module 4: Delivering Great Service creates feedback loops enabling improvement:

- Portfolio management (Section 4.2) provides structure for service improvement
- Knowledge management (Section 4.3) enables learning and improvement
- Customer service (Section 4.4) surfaces improvement opportunities through feedback
- Business relationships (Section 4.5) create partnerships enabling collaborative improvement

Service excellence creates the trust and employee engagement that enable ongoing evolution.

The Authority = Accountability Principle in Continuous Improvement

Throughout this framework, we've emphasized: authority must match accountability.

This principle is especially critical for continuous improvement:

People cannot improve what they lack authority to change. If service desk staff are accountable for ticket resolution time but lack authority to modify support processes, improvement doesn't happen. If network administrators are accountable

for network reliability but lack authority to implement new management tools, improvement stalls.

Continuous improvement requires distributed authority, people must have authority to improve their areas of responsibility. This doesn't mean chaos; boundaries exist. But within those boundaries, authority to experiment, pilot, and improve must exist.

Many organizations fail at continuous improvement because they create accountability for improvement without granting authority to improve. They expect innovation while maintaining rigid approval processes that kill experimentation. They demand engagement while treating staff as order-takers.

Lasting improvement requires matching authority and accountability at every level: individual contributors, service owners, teams, and leadership.

Continuous Improvement Is Never Complete

The opening story illustrated critical point: there is no "done."

When improvement becomes an ongoing practice and cultural shift rather than a one-time initiative, there will always be new areas for improvement.

You don't "implement continuous improvement" and check the box. You build the capability, create the systems, and shape a culture where getting better is just how things work.

Three years from now, your organization should look different from today. Continuous improvement made you progressively better at everything you do.

Five years from now, you should have capabilities you don't have today, be delivering value you're not delivering today, and have solved problems that currently seem intractable.

Ten years from now, your organization should be unrecognizably better while maintaining core identity and values.

Sustainable continuous improvement produces organizations that evolve continuously while remaining true to their purpose.

Getting Started

The CIO from the opening story learned his lesson. After eighteen months of stagnation, he reframed the work: "We haven't completed transformation. We've built capability to transform continuously. The real work begins now."

He implemented the practices in Module 5: protected improvement time, feedback systems, performance management for improvement, systematic innovation. Three years later, the organization was demonstrably better than during the original "victory" celebration, and still improving.

Module 5 enables exactly this: organizations that never stop getting better.

The sections that follow provide frameworks, practices, and guidance for building this capability. Use them systematically. Adapt them to your context. But commit to the work.

Because in organizational development, there is no arrival. You're either improving or falling behind.

Choose improvement.

The work continues.

Section 5.1

Feedback and Engagement

The problem had been plaguing her organization for months. The help desk system was clunky, tickets were being lost, and IT staff were getting increasingly frustrated with workarounds they'd created to make it function.

The problem was obvious to everyone doing the work. But it wasn't getting fixed.

When she asked why, the answer revealed a deeper issue: "We mentioned it to management a few times, but nothing happened. So we just figured we had to live with it."

Think about that. Her staff had identified a problem that was costing them hours every week, affecting their ability to serve customers, and creating unnecessary stress. They knew what the problem was. They likely had ideas about how to fix it. But they'd stopped raising it because they'd learned their feedback didn't matter.

That's not just a problem with one system. That's a cultural problem that undermines continuous improvement at every level.

She realized that before she could improve anything, systems, processes, service quality, she had to rebuild something more fundamental: the feedback culture. People needed to believe their observations mattered. That problems they identified would be taken seriously. That their ideas for improvement would be considered.

It took six months to rebuild that trust. But once people started believing feedback led to action, everything changed. Not just the help desk system, everything. Problems surfaced faster. Solutions came from unexpected places. The organization became capable of improving itself.

This section focuses on creating the feedback systems and engagement culture that make continuous improvement possible.

The Foundation: Why Feedback Matters

Continuous improvement doesn't happen by decree. You can't mandate your way to an organization that learns and evolves. It happens when you build an environment where improvement becomes natural, where identifying problems and implementing solutions is part of how people work, not an extra burden on top of their real jobs.

Those conditions start with feedback.

Feedback is how problems surface. It's how you learn what's working and what isn't. It's how frontline staff, the people closest to the work, share their observations with leadership. It's how improvement ideas move from "someone should fix this" to actual action.

Without effective feedback systems, you're flying blind. You're making decisions based on what you think is happening, not what's happening. Problems fester until they become crises. Good ideas die unspoken. The gap between leadership's perception and operational reality grows wider.

The data supports this. Organizations with strong feedback cultures show measurably higher performance outcomes. Employees who receive continuous feedback are far more likely to feel motivated to do outstanding work compared to those who only receive annual reviews. Companies in the top quartile for feedback effectiveness show measurably lower turnover rates than those who provide no meaningful feedback.

What's critical for local government IT: feedback goes beyond performance management. It's about organizational learning. In an environment where you're constantly facing new challenges, new security threats, new technologies, new business demands, new regulatory requirements, your ability to learn and adapt determines whether you thrive or merely survive.

Feedback is the mechanism through which learning happens.

The Two Directions of Feedback

Most organizations think about feedback as flowing in one direction: from leadership to staff. Performance feedback. Corrective feedback. Recognition. That's important, but it's only half the picture.

For continuous improvement, you need feedback flowing in both directions.

Downward feedback: Leadership providing staff with information about performance, expectations, priorities, and direction. This includes:

- Recognition of good work and contributions
- Guidance on areas for development
- Clarity on organizational priorities and strategy
- Context for decisions and changes

Upward feedback: Staff providing leadership with information about operations, problems, opportunities, and ideas. This includes:

- Problems identified in daily work
- Process inefficiencies or barriers

- Ideas for improvements
- Customer feedback and needs
- Reality checks on policies and initiatives

Both directions matter. But in most organizations, downward feedback dominates while upward feedback is weak or non-existent. Leadership talks, staff listens. That's not a feedback culture, that's a one-way communication culture.

Continuous improvement requires strong upward feedback. Because the people doing the work see things leadership can't see. They know which processes create unnecessary friction. They understand where systems fall short. They have ideas about how to work more effectively. But only if they believe their feedback will be heard and acted upon.

Feedback systems as communication infrastructure. Feedback systems are the formal communication infrastructure that enables organizational learning and improvement. Your one-on-ones are feedback infrastructure. Your team meetings are feedback infrastructure. Your surveys and suggestion systems are feedback infrastructure. Every feedback mechanism you create is communication infrastructure that either enables or inhibits continuous improvement. **If you view feedback systems as bureaucratic overhead rather than essential communication capability, you'll underinvest in them and wonder why improvement doesn't happen.**

The Feedback Culture Assessment

Before you can improve your feedback systems, you need to understand where you are. To assess your current feedback culture:

Signs of weak feedback culture:

- Problems are discussed informally but never formally raised
- Staff say "that's just how it is here" about persistent issues
- Good ideas die in hallway conversations
- People wait to be asked rather than volunteering observations
- Feedback only flows when someone is in trouble
- Annual surveys happen but nothing changes afterward
- Staff don't see connection between their input and organizational actions

Signs of strong feedback culture:

- People regularly raise issues through established channels
- Leadership actively solicits input before making decisions
- Staff see clear examples of feedback leading to change
- Multiple formal and informal mechanisms exist for sharing observations
- Both problems and ideas are welcomed equally
- People feel psychologically safe raising concerns

- Feedback is bidirectional, staff give it, leadership seeks it

Be honest about where your organization falls. Most local government IT organizations have weak feedback cultures because the systems and norms that enable it were never built, not from lack of caring.

The good news: this is fixable. You can deliberately build the feedback mechanisms and cultural norms that enable continuous improvement.

Building Effective Feedback Systems

Effective feedback systems have several key characteristics:

1. Multiple channels for input

Don't rely on a single feedback mechanism. Different people are comfortable with different approaches. Some will raise issues in one-on-ones. Others prefer written submissions. Some need anonymity. Create multiple pathways:

Formal channels:

- Regular one-on-one meetings (manager-staff)
- Team meetings with dedicated "issues and improvements" agenda item
- Quarterly or semi-annual surveys
- Suggestion system (physical or digital)
- Skip-level meetings (staff meet with their manager's manager)

Informal channels:

- "Open door" times when leadership is available
- Hallway conversations that are taken seriously
- After-action reviews following projects or incidents
- Coffee chats or lunch roundtables

Anonymous channels:

- Anonymous suggestion box
- Anonymous survey questions
- Third-party ombudsman or HR channel for sensitive issues

You need all three types available. Some feedback requires attribution and dialogue. Some doesn't. Staff should be able to choose the channel that fits their comfort level and the nature of what they're sharing.

2. Regular solicitation, not just passive acceptance

Waiting for feedback to come to you doesn't work. Most people won't volunteer observations unless explicitly invited. You have to actively seek input.

This means:

- Asking specific questions: "What's one process that frustrates you this month?"

- Creating regular opportunities: "We review our policies quarterly, what should we examine?"
- Making it part of routine: Every project retrospective includes "What should we improve?"
- Being explicit: "I need your input on this decision before we finalize it"

Data shows that leaders who actively seek feedback experience measurably higher employee engagement compared to those who wait passively for input to come to them. Active solicitation signals that feedback is valued, not just tolerated.

3. Timely response and clear action

That's where most feedback systems break down. Organizations collect feedback but fail to close the loop. Staff share observations but never hear what happened with their input. Over time, people stop bothering because they've learned feedback disappears into a black hole.

Closing the feedback loop means:

Acknowledgment: When someone provides feedback, acknowledge receipt immediately. "Thank you for raising this. I'm looking into it."

Investigation: Actually investigate the issue or idea. Don't just dismiss it or assume you know the answer. Talk to relevant people. Gather facts. Consider seriously.

Decision: Decide what action, if any, makes sense. Not every piece of feedback leads to change, that's okay. But you need a decision: implement, modify, table for future consideration, or decline with explanation.

Communication: Tell the person who provided feedback what decision was made and why. If implementing their idea: "We're addressing this, here's the plan and timeline." If not implementing: "Here's why we're not pursuing this right now, but we appreciate you raising it."

Visibility: When feedback leads to improvement, make that visible to the organization. "Based on feedback from the help desk team, we're implementing these workflow changes. Thanks to Sarah and Miguel for identifying this issue."

Research consistently shows that employees are far more likely to stay at organizations that invest in their development and respond to feedback with action. Closing the feedback loop is critical for retention and engagement.

Closing the loop IS communication work. Notice that effective feedback requires intensive communication: acknowledging input, investigating issues, making decisions, communicating outcomes, making results visible. **This is leadership communication work, not administrative tasks to delegate.** When your staff provide feedback, they're giving you the information you need to lead effectively. How you handle that communication signals whether you value their input and expertise. Leaders who view "closing the feedback loop" as bureaucratic overhead rather than core communication responsibility create cultures where feedback stops

flowing. **The time you invest in feedback communication directly determines your organization's capacity for improvement.**

For smaller IT teams (5–10 people): Keep feedback systems simple. Monthly team meetings where you explicitly ask "What's one thing we should improve?" Weekly one-on-ones with each person. Quarterly anonymous pulse check (5–7 questions via simple survey tool). Consistency matters more than complexity.

For mid-sized teams (11–30 people): Layer in more structure. Monthly team meetings plus quarterly cross-functional forums. Biweekly one-on-ones. Annual full survey with quarterly pulse checks. Establish clear process for how improvement suggestions move from idea to evaluation to decision.

For larger teams (31–50+ people): Formalize more. Create improvement task force that reviews suggestions monthly. Implement online suggestion system with visible status tracking. Make sure every level of management is having regular one-on-ones. Create "skip level" meetings where staff meet with senior leadership quarterly. Annual survey with quarterly pulses across different dimensions.

The 20% Principle: Embedding Improvement in How You Work

Here's a principle that transforms organizations: dedicate 20% of your capacity explicitly to improvement work.

This doesn't mean everyone works on improvement 20% of the time (though some organizations do exactly that). It means that roughly 20% of your organizational capacity, time, budget, attention, goes toward making things better, not just keeping things running.

This principle was famously implemented at Google as "20% time," where engineers could spend one day per week working on projects of their own choosing. That policy contributed to the creation of products like Google News and AdSense. (Gmail is often associated with 20 percent time, though its creator has noted it was developed as part of his regular role.) Google's implementation has evolved over the years, but the principle remains: when you give people permission and resources to improve things, improvement happens.

In smaller organizations like local government IT, the 20% principle works differently but achieves the same goal.

The 20% principle at each level:

At the individual level: Staff are explicitly told that improving how we work is part of their job, not extra work they squeeze in when everything else is done. When someone says "I don't have time to document this process," the response is "Then we need to adjust your workload, because documentation is part of the work, not separate from it."

At the team level: Every sprint, iteration, or work period includes capacity for improvement. If you're using agile methodologies, improvement stories go in the backlog. If you're more traditional, improvement projects are part of the portfolio.

The message: improvement isn't what we do when we have spare time, it's part of how we work.

At the organizational level: Your budget, strategic plan, and resource allocation reflect the 20% principle. Budget includes line items for tools that improve efficiency. Strategic plans include improvement objectives. Performance expectations include contribution to improvements, not just operational work.

Common objection: "We're too busy just keeping things running to spend 20% on improvement."

This is backwards. You're busy precisely because you haven't invested in improvement. You're trapped in reactive mode because your processes, systems, and practices are inefficient. The 20% principle isn't a luxury you can afford only when things are calm, it's how you create the calm.

Think about it: if you spend 100% of your capacity on operational work, you'll be working with today's processes and systems forever. You'll never get better. You'll never become more efficient. You'll never reduce the burden of keeping things running. The work will perpetually expand to fill all available capacity.

But if you protect 20% for improvement, even when it feels like you can't afford it, you gradually make the 80% operational work more efficient. Problems get solved at root cause rather than repeatedly patched. Processes get simplified. Automation eliminates manual work. Knowledge gets documented so you're not constantly reinventing wheels.

Over time, the operational work requires less than 80% of capacity because you've systematically improved it. That's the compounding effect of continuous improvement.

Employees who participate in dedicated improvement time consistently report feeling more engaged in their work, and organizations see measurable productivity gains from the innovations that emerge from these initiatives. The psychological impact of being trusted to improve your own work environment is significant.

How to implement the 20% principle in small organizations:

Start with 5–10%: Don't jump to 20% immediately if you're at 0% now. Start smaller. Dedicate one afternoon per week for the team to work on improvements. Build from there.

Make it visible: Put improvement work on your project board, sprint backlog, or work plan. If it's invisible, it's not real. People need to see that improvement work is legitimate work.

Remove the guilt: Staff need to know that working on improvement is not shirking their "real" duties. Explicitly tell them: "Improving our documentation is as important as fixing tickets" or "Simplifying this process is a priority, not something you should feel bad about spending time on."

Celebrate improvements: When someone implements an improvement, even a small one, recognize it publicly. "Maria streamlined our patch management

workflow and saved us 4 hours per month. This is exactly the kind of improvement we need more of."

Measure improvement capacity: Track what percentage of your capacity goes to improvement. Are you at 1%? 5%? 10%? Set a target and work toward it. This measurement itself drives behavior change.

Tie it to performance: Include "contribution to organizational improvement" in performance expectations and evaluations. If you only measure operational work, people will only do operational work. What you measure is what you get.

The Engagement Connection

Everything we've discussed, feedback systems, the 20% principle, improvement culture, connects directly to employee engagement. Engagement predicts retention, performance, and organizational capability.

Engaged employees are those who:

- Feel their work matters and connects to purpose
- Have the tools and resources to do their work well
- Receive recognition and feedback regularly
- Feel heard and see their input leads to action
- Have opportunities to grow and develop
- Work in an environment where they feel psychologically safe

Notice how many of these tie directly to feedback and continuous improvement. When people's ideas lead to actual improvements, they feel heard. Dedicated time for improving their own work builds professional growth. And when feedback flows both ways, people see how their daily work connects to the organization's mission.

Continuous improvement culture and employee engagement are inseparable.

Engagement research, including data from platforms like Quantum Workplace, shows that employees who receive substantive feedback are much more engaged and less likely to leave their organization. Gallup's extensive research demonstrates that engagement levels drop precipitously when employees feel their opinions don't count or when they receive no feedback between annual reviews.

For local government IT, where recruiting and retaining technical talent is increasingly difficult, engagement isn't optional. You can't afford to lose good people because they don't feel heard or don't see opportunities to grow and contribute.

Engagement measurement for continuous improvement:

Don't just measure engagement annually and call it good. Create ongoing mechanisms:

Pulse surveys (quarterly): 5–10 questions that take 5 minutes to complete. Track trends over time. Focus on key indicators: "I have opportunities to contribute ideas," "My feedback leads to action," "I'm learning and growing in my role."

One-on-one check-ins: Every manager should be assessing engagement informally in regular one-on-ones. Not through formal surveys, but through questions: "How are you feeling about your work?" "What's energizing you? What's draining you?" "What would help you be more effective?"

Exit interviews: When people leave, understand why. Was it compensation? Growth opportunities? Feeling unheard? Lack of challenge? Exit interviews are feedback gold, painful but invaluable.

Stay interviews: Don't just interview people when they leave. Interview them while they're staying. "What keeps you here?" "What would make you consider leaving?" "What can we do to ensure you want to stay long-term?" These conversations surface issues while you can still address them.

Engagement red flags in continuous improvement context:

- People stop raising issues or suggesting improvements
- Participation in improvement activities drops
- Feedback in surveys becomes cynical ("Why bother? Nothing changes anyway")
- High performers leave, citing lack of growth or input opportunities
- Staff say they feel like "just a cog in the machine"
- Innovation and creative problem-solving decline

These are signals that your feedback and improvement culture needs attention.

Creating Psychological Safety

None of the feedback systems or improvement practices work if people don't feel psychologically safe. Psychological safety, the belief that you can speak up, take risks, and make mistakes without being punished or humiliated, is the basis of both effective feedback and continuous improvement.

Harvard Business School professor Amy Edmondson's study demonstrates that psychological safety is the key differentiator between high-performing and low-performing teams. Teams where people feel safe to share concerns, admit mistakes, and challenge ideas learn faster and perform better.

In IT organizations, psychological safety is especially critical because:

- Technology work involves complex systems where mistakes are inevitable
- Learning requires experimenting, which means some experiments will fail
- The best improvements often come from questioning existing approaches
- Rapid change means being wrong is frequent, if you punish being wrong, you kill learning

Building psychological safety:

Model vulnerability: Leaders who admit mistakes, acknowledge uncertainty, and ask for help create safety for others to do the same. If you as CIO say "I was

wrong about that technical decision" or "I don't know the answer, let's figure it out together," you give permission for others to be human.

Respond well to bad news: When someone brings you a problem or admits a mistake, your response determines whether they'll bring you the next problem. Responding with "Why did you let this happen?" shuts down future honesty. Responding with "Thank you for catching this, let's figure out how to address it" encourages it.

Separate learning from accountability: Make clear distinction between blame (appropriate when someone intentionally violates policy or acts negligently) and learning (appropriate when someone made a mistake while trying to do good work). Most situations are learning opportunities, not blame situations.

Reward speaking up: When someone raises a concern that prevents a problem, recognize it. When someone challenges a decision and leads to a better outcome, celebrate it. When someone admits a mistake early enough to fix it, praise the honesty.

Never punish questions: If you want people to challenge assumptions and think critically, you can't punish questioning. Questions like "Why are we doing it this way?" or "Have we considered the alternatives?" should be welcomed, not seen as insubordination.

Depersonalize problems: Frame issues as "our process has a flaw" not "you made a mistake." Frame improvement as "we can get better at this" not "you're not doing this well enough." Language matters enormously.

For smaller organizations, psychological safety is both easier and harder to build. Easier because you have fewer people and can address cultural issues faster. Harder because every interaction carries more weight, one negative response to feedback can damage safety for weeks.

How This Connects to the Broader Framework

Feedback and engagement run through every module you've already worked on. What's new in Module 5 is making these threads systematic and sustainable:

Your personal leadership skills (Module 1) set the tone:

- Your communication skills (Section 1.5) determine how effectively you solicit and respond to feedback
- Your self-awareness (Section 1.3) enables you to hear feedback about your own leadership without defensiveness
- Your time prioritization (Section 1.2) determines whether you make space for feedback and improvement work

Organizational health (Module 2) determines integration success:

- Culture (Section 2.5) determines whether feedback is psychologically safe
- Vision and purpose (Section 2.2) provide the "why" that gives improvement its purpose

- Capabilities and people development (Section 2.4) give staff skills to identify and implement improvements
- Communications (Section 2.6) carry feedback throughout the organization

The governance and strategic structures from Module 3 connect here:

- Governance (Section 3.1) provides structure for evaluating and prioritizing improvement initiatives
- Strategic planning (Section 3.2) connects organizational goals to what needs improving, you're not improving randomly, you're improving strategically
- Portfolio management is how you operationalize the 20% principle, improvement work competes for and receives resources

Service delivery (Module 4) generates the feedback:

- Customer service (Section 4.4) depends on upward feedback, frontline staff tell you what customers need
- Knowledge management (Section 4.3) captures improvements so they become institutional learning
- Business relationships (Section 4.5) provide external feedback about how IT is perceived and where to improve

To the rest of Module 5:

- Section 5.2 (Organizational Integration) embeds improvement governance into existing organizational decision-making, using the feedback gathered here to identify integration opportunities
- Section 5.3 (Making Things Better) creates the leadership framework where improvement ideas are captured, evaluated, and resourced
- Section 5.4 (Performance Management) builds accountability systems that track improvement work and depend on the continuous feedback culture established here
- Section 5.5 (Innovation Leadership) extends improvement to breakthrough change, requiring the psychological safety and engagement built through effective feedback systems

These threads run together. You can't sustain continuous improvement without honest feedback, and honest feedback won't happen without psychological safety. That safety? It depends on your leadership skills. And the whole system needs grounding in strategy, governance, and resources.

Key Takeaways

- Continuous improvement requires feedback flowing in both directions: from leadership to staff AND from staff to leadership

- Weak feedback cultures are characterized by problems that don't surface, ideas that die unspoken, and staff who've learned their input doesn't matter
- Effective feedback systems have multiple channels, actively solicit input, and always close the loop by communicating decisions and actions
- The 20% principle, dedicating roughly 20% of capacity to improvement work, transforms organizations from reacting to anticipating
- Employee engagement and continuous improvement culture are inseparable, engaged people improve things, and improvement opportunities engage people
- Psychological safety is the prerequisite. Without it, people won't share honest feedback or take risks on improvement initiatives
- Feedback and improvement work aren't extra burdens, they're core work that makes all operational work more effective over time

Reflection Questions

Assess your organization's feedback and engagement culture:

1. If you asked your team "Do you feel your feedback leads to action?" what would they honestly say?
2. What percentage of your current capacity goes to improvement work versus just keeping things running? Is that percentage growing or shrinking?
3. When was the last time someone on your team challenged a decision or process, and how did you respond?
4. Can you identify three specific examples from the past six months where staff feedback led to visible organizational change?
5. Do people on your team feel psychologically safe admitting mistakes and raising concerns? What evidence supports your answer?
6. What feedback channels exist in your organization? Are they formal, informal, anonymous? Are all three types available?
7. How long does it typically take to respond to feedback or suggestions? Days? Weeks? Months? Never?

The working documents for this section are in Appendix A.5.1.

Section 5.2

Organizational Integration

A CIO I know told me about the moment that changed how her organization approached IT governance. For years, she had been working to get departments to route technology purchases through IT for review and approval. She'd created forms, sent emails, and presented to department heads. She'd even gotten the County Executive to endorse the policy.

And departments kept bypassing it.

They weren't being malicious. They just… forgot. Or they were in a hurry. Or they didn't think their particular purchase "counted" as something IT needed to review. So IT projects kept showing up on the Board of Supervisors agenda without IT ever seeing them. Departments would commit to technology investments without understanding the enterprise implications. And IT would find out about new systems after they were already approved.

The breakthrough came from an unexpected place: the County Administrative Officer's office manager, who was responsible for preparing Board meeting agendas. During a casual conversation, she mentioned to the CIO: "You know, I review every item before it goes on the agenda. I ensure it has the right attachments, legal review, budget codes. I could flag technology items that haven't been through IT governance."

That simple addition to an existing workflow changed everything. The CAO's office added one line to their pre-agenda checklist: "If this item involves technology procurement, implementation, or ongoing systems, has IT reviewed it?" Items without IT review got flagged back to the department before going to the Board.

Overnight, the bypass problem disappeared. Not because departments suddenly became more compliant. Because the check was embedded in a process they already

had to follow anyway. IT governance went from something separate they could forget about to part of the normal flow of business.

That's organizational integration at work, making IT processes so embedded in how the organization works that they become invisible, inevitable, and effective.

The Problem with Separate Processes

Most IT organizations operate on an island. They create their own processes, forms, approval workflows, and communication channels. They design systems that make sense from IT's perspective but sit off to the side of how the broader organization functions.

This separateness creates persistent problems:

Process avoidance: When IT requires a separate workflow, a unique form, a different approval path, a special meeting, people find ways to skip it. Not out of malice, but because everyone is already overwhelmed with their existing processes. Adding another one just gets ignored or forgotten.

Low engagement: Try scheduling an "IT Governance Council" meeting and see how many department heads show up consistently. Now notice how they never miss the regularly scheduled Department Head meeting. The difference? One is perceived as optional IT business; the other is mandatory organizational business.

Shadow IT: When official IT processes are too cumbersome or separate from normal workflows, people create workarounds. They buy technology without IT approval. They hire consultants to build systems outside IT. They use personal tools for work tasks. According to research, a significant percentage of employees acquire, modify, or create technology without IT department knowledge, and this proportion is projected to grow substantially in coming years. The root cause isn't that people are trying to undermine IT, it's that IT's processes don't integrate with how work gets done.

Communication gaps: IT sends separate newsletters, holds separate meetings, maintains separate channels. So IT messages compete with everything else for attention, and usually lose.

Lack of accountability: When IT processes sit outside the organization's main accountability structures, they lack real authority. Departments can ignore IT requirements because those requirements aren't part of the governance and management structures where they're held accountable.

This last point connects directly to a principle we've emphasized throughout the HPG-IT Framework: **authority must match accountability.** When IT tries to operate separate processes, IT often lacks real authority because those processes aren't in the accountability structures. You're asking people to follow requirements that aren't part of where they're measured and held accountable. Integration solves this by embedding IT requirements into existing accountability structures.

The traditional response to these problems is to push harder, send more emails, make the policy more explicit, escalate non-compliance to leadership. But that's treating symptoms, not the disease. The disease is separation.

The solution is integration.

What Integration Means

Organizational integration means embedding IT processes into the enterprise's existing structures, workflows, and rhythms rather than maintaining separate IT-specific mechanisms.

Instead of creating a new meeting, add IT items to existing meetings.

Instead of creating a new approval workflow, embed IT review into existing approval processes.

Instead of creating separate communication channels, use the organization's established communication mechanisms.

Instead of operating as a separate function, position IT as an integrated capability that runs through existing business processes.

It doesn't mean IT has no unique processes or requirements. It means those processes connect to and build on what already exists rather than operating in parallel.

The 2024 trend study on Governance, Risk, and Compliance describes this shift directly: moving governance into existing business workflows rather than layering it on top. The research frames this as pushing accountability into actual business processes rather than adding separate compliance requirements disconnected from daily work.

The same principle applies to IT processes. Integration means moving from "additional layers" that people can bypass to embedded requirements that are part of how business gets done.

Benefits of Integration

When IT processes are fully integrated into enterprise operations, multiple benefits emerge:

Higher compliance: People follow processes they can't bypass. When IT review is embedded in existing workflows, like the agenda management example, compliance becomes automatic rather than voluntary.

Better engagement: Adding 15 minutes of IT discussion to an existing department head meeting gets 100% attendance. Creating a separate IT meeting gets 50% attendance (if you're lucky). Same content, vastly different engagement.

Reduced shadow IT: When IT processes work with organizational workflows rather than against them, people stop creating workarounds. Research tells us that shadow IT is "rarely the result of malicious intent. More often than not, it's driven by employees struggling to use sanctioned tools or corporate processes to complete specific tasks." Integration removes the friction that drives shadow IT.

Stronger relationships: Integration forces ongoing interaction with business partners. IT isn't off in a corner doing IT things, IT is part of regular business conversations, building relationships continuously rather than episodically.

Greater efficiency: Using existing meetings, approval workflows, and communication channels is more efficient than creating parallel structures. Every new IT meeting = 1 hour x however many people x however many times per year. That adds up fast. Integration eliminates much of that overhead.

Enterprise alignment: When IT participates in existing governance, planning, and communication mechanisms, IT naturally stays connected with organizational priorities. You're in the conversations where priorities are set rather than learning about them later.

Real authority: Integration gives IT actual authority, not just policy statements, but embedded checkpoints where IT input is required for business processes to proceed. Authority that derives from position in existing structures is far more effective than authority that relies on policy compliance.

Integration Opportunities: Where to Embed IT

Consider specific areas where IT processes can be integrated into enterprise operations rather than maintained separately.

1. Procurement and Vendor Management

The separate approach: IT creates its own technology procurement process with unique forms, approval workflows, and vendor management practices. Departments must work through both IT's process and the organization's procurement process, creating duplicate work and confusion.

The integrated approach: IT partners with the Procurement/Finance department to embed technology considerations into existing procurement workflows.

In practice:

- **Purchase requisition system:** Add fields for technology items that automatically route to IT for review. Not a separate form, just additional routing logic in the existing system.
- **Vendor onboarding:** IT security reviews become part of standard vendor onboarding process managed by Procurement, not a separate IT vendor approval process.
- **Contract templates:** IT requirements (security terms, data handling, service levels) are built into standard contract templates managed by legal/procurement, not separate IT contracts.
- **P-Card policies:** Technology purchase thresholds and requirements are incorporated into existing purchasing card policies and controls, not separate IT spending rules.

- **Budget cycle:** Technology budget requests flow through the standard organizational budget process with IT as a reviewer/advisor, not a separate IT budgeting process.

Benefits: Departments follow one procurement process that includes IT considerations rather than two separate processes. Procurement staff handle routine technology purchases using standard workflows with IT guardrails built in. IT focuses on guidance and exceptions rather than processing routine transactions.

A majority of businesses have now automated at least one process, with integration being a key driver of adoption. Organizations that integrate IT requirements into existing procurement automation see higher compliance and lower overhead than those maintaining separate IT approval processes.

2. HR and Training Partnership

The separate approach: IT runs its own training programs on separate schedules with separate enrollment. Departments must track both enterprise training requirements and IT-specific training, and employees see IT training as something extra.

The integrated approach: IT partners with HR to embed technology and security training into enterprise training infrastructure.

What this looks like:

- **New employee onboarding:** Technology orientation and security training are modules within standard onboarding program managed by HR, not separate IT onboarding.
- **Annual compliance training:** Cybersecurity awareness is a module alongside harassment prevention, safety, and other compliance topics in the organization's annual training, not separate IT security training.
- **Skills development:** Technology skills training is part of the enterprise professional development program with shared Learning Management System, not IT-only training tracks.
- **Training tracking:** IT training completion is tracked in the same HR system that tracks all other training, providing single source of truth for compliance reporting.
- **Performance integration:** Technology competency requirements are incorporated into job descriptions and performance evaluations managed by HR, not separate IT skill assessments.

Benefits: Employees have one training dashboard, one schedule, one set of requirements. HR handles training administration and compliance tracking using existing infrastructure. IT provides content and expertise rather than running parallel training operations.

3. Risk Management and Cybersecurity

The separate approach: IT manages cybersecurity as an IT function with separate risk assessments, incident response, and compliance reporting. Risk Management handles enterprise risk with separate framework. Two parallel risk management systems exist.

The integrated approach: Cybersecurity is positioned as enterprise risk managed within existing Risk Management/Internal Audit framework, with IT providing technical expertise.

How this works:

- **Enterprise risk register:** Cyber risks are integrated into the organization's master risk register maintained by Risk Management, not separate IT risk tracking.
- **Risk assessment cycle:** Cybersecurity assessments happen on the same schedule and use the same methodology as other enterprise risk assessments, with IT providing technical expertise.
- **Board reporting:** Cyber risk is reported to the Board as part of overall enterprise risk dashboard, not separate IT security reports.
- **Incident response:** Cyber incidents are managed through existing enterprise incident management framework (coordinated by Risk/Emergency Management), with IT providing technical response capabilities.
- **Compliance framework:** Cyber compliance (NIST, CJIS, HIPAA technical requirements) is integrated into enterprise compliance management system rather than separate IT compliance tracking.
- **Insurance and liability:** Cyber insurance is managed as part of enterprise insurance program by Risk Management/Finance, not separate IT insurance.

Benefits: Leadership sees unified risk picture rather than fragmented views. Cyber risks are evaluated using same criteria as other enterprise risks. Resources for risk mitigation flow through same prioritization process. Organization develops consistent risk culture rather than separate IT and business risk cultures.

The 2024–2025 trend toward integrated GRC is clear in the data: "GRC management will be increasingly collaborative and a cross-functional responsibility. This trend emphasizes visibility and consistency in GRC processes across all departments and functions."

4. Facilities and Construction Integration

The separate approach: Facilities manages construction and remodel projects. IT finds out about them late and tries to retrofit technology needs. Two separate project teams with separate schedules create coordination nightmares and missed opportunities.

The integrated approach: Technology is integrated into facilities projects from the beginning, with IT as a stakeholder in existing project management processes.

What this looks like:

- **Project initiation:** Facilities project charters include IT as automatic stakeholder for any project involving occupied space, not IT discovering projects after they start.
- **Design phase:** IT participates in design reviews using existing review checkpoints, ensuring technology infrastructure (network, power, AV, physical security) is designed in rather than added later.
- **One project team:** Single project team including facilities, IT, and other stakeholders, not separate facilities and IT projects that have to coordinate.
- **Integrated schedule:** Technology installation is part of overall project schedule and critical path, not separate IT project that might or might not align.
- **Shared project management:** One project manager coordinates all aspects including technology, using enterprise project management methodology and tools.
- **Joint walkthroughs:** Technology requirements are validated during same construction walkthroughs and punchlist processes as other building systems, not separate IT walkthroughs.

Benefits: Technology infrastructure gets designed in properly rather than retrofitted. Costs are managed together rather than fragmented. Schedules align and hand-offs are clean. No surprises where building is ready but technology isn't, or technology is ready but building isn't.

5. Governance and Business Relationship Management

The separate approach: IT creates separate governance council that nobody attends. IT schedules separate meetings with departments to discuss their needs. IT maintains separate communication channels. All exist parallel to the organization's regular governance and communication structures.

The integrated approach: IT governance and relationship management are embedded into existing meetings and structures where business is conducted.

This looks like:

- **Department head meetings:** Regular agenda item for IT updates, project prioritization, and issue escalation. CIO presents monthly at standing meeting that everyone already attends, not separate IT meetings.
- **Budget meetings:** IT participates in regular budget development and review meetings rather than having separate IT budget sessions that other departments skip.

- **Strategic planning sessions:** IT is at the table during regular strategic planning retreats and sessions, not conducting separate IT strategic planning.
- **Board workshops and meetings:** CIO presents IT strategy, major projects, and cyber risks at regular Board meetings and workshops rather than requesting special IT-only sessions.
- **Executive team meetings:** CIO attends regular executive leadership team meetings as member of leadership, not as occasional guest presenter on IT topics.
- **Department business meetings:** IT representatives regularly attend department staff meetings (rotating schedule) to hear their issues and provide support, not waiting for departments to come to IT.

Benefits: IT gets full attention from decision-makers who are already present for organizational business, not competing for time on overscheduled calendars. IT hears about priorities, challenges, and initiatives in real-time rather than secondhand. Business leaders see IT as part of leadership team, not separate function. Relationship building happens continuously through regular interaction rather than episodically through special meetings.

The same principle applies at the organizational level. Departments engage more with IT when IT is embedded in their regular operations rather than operating separately.

The "Meeting Math" That Changes Minds

One of the most compelling arguments for integration is simple arithmetic. Let's walk through it:

Separate meeting approach:

- IT Governance Council: 1 hour x 15 people x 12 times/year = 180 hours
- IT Strategic Planning Session: 3 hours x 12 people x 2 times/year = 72 hours
- IT Project Review Meetings: 1 hour x 8 people x 12 times/year = 96 hours
- Individual IT/Department meetings: 1 hour x 10 departments x 6 times/year = 60 hours
    - ***Total: 408 hours per year of meeting time***

Integrated approach:

- IT update item at monthly Department Head meeting: 15 minutes x 15 people x 12 times/year = 45 hours
- IT participation in existing strategic planning: 0 hours (already scheduled)
- IT participation in existing budget meetings: 0 hours (already scheduled)
- IT presence at rotating department meetings: 1 hour x 1 IT person x 10 departments x 6 times/year = 60 hours

- ***Total: 105 hours per year of meeting time***

Savings: 303 hours per year

The key: the integrated approach typically gets better attendance, engagement, and follow-through because it uses meetings people already prioritize rather than creating new commitments that compete for limited time.

This math is especially compelling for smaller organizations where every hour matters. In a local government of 70K population with 20 IT staff, you cannot afford to layer additional meetings on top of existing obligations. Integration is the only lasting approach.

Starting Point: Assessing Current Integration

Before you can improve integration, you need to understand where you currently stand. Use this assessment to evaluate your organization:

Procurement and Purchasing:

- Does technology procurement flow through the same system as other purchases, or separate IT process?
- Are IT requirements built into standard contract templates, or separate IT contracts?
- Do departments use normal procurement channels for technology, or come directly to IT?
- Is IT involved in vendor management through existing processes, or separately?

Score: Fully Integrated (5) → Partially Integrated (3) → Completely Separate (1)

Training and Development:

- Is IT training part of the enterprise LMS and onboarding, or separate IT training programs?
- Is cybersecurity training included in annual compliance training, or separate IT security training?
- Are technology competencies in job descriptions managed by HR, or tracked separately by IT?

Score: Fully Integrated (5) → Partially Integrated (3) → Completely Separate (1)

Risk Management:

- Are cyber risks in the enterprise risk register, or tracked separately by IT?

- Is cyber incident response part of enterprise emergency management, or separate IT process?
- Does the Board see cyber risk integrated with other risks, or separate IT reports?

Score: Fully Integrated (5) → Partially Integrated (3) → Completely Separate (1)

Governance and Decision-Making:

- Does IT present at regular Department Head meetings, or try to hold separate IT meetings?
- Is the CIO at regular executive team meetings, or only invited for IT topics?
- Are IT projects reviewed in existing governance structures, or separate IT governance?

Score: Fully Integrated (5) → Partially Integrated (3) → Completely Separate (1)

Communication:

- Does IT use existing organizational communication channels, or separate IT communications?
- Is IT included in regular organizational updates, or sends separate IT updates?
- Does IT participate in existing all-staff events, or holds separate IT events?

Score: Fully Integrated (5) → Partially Integrated (3) → Completely Separate (1)

Total Score:

- 21–25: Highly integrated, IT is embedded in organizational DNA
- 11–20: Partially integrated, mix of embedded and separate processes
- 5–10: Siloed, IT operates mostly independently of organizational structures

For most IT organizations, this assessment reveals significant opportunities for integration.

Prioritizing Integration Opportunities

You can't integrate everything at once. Use this framework to prioritize where to start:

High Impact + Low Effort = Start Here

These are the quick wins that demonstrate integration benefits:

- Adding IT agenda item to existing regular meetings (Department Heads, Executive Team)

- Embedding technology flag in Board agenda preparation process
- Incorporating IT requirements into existing contract templates
- Including cybersecurity in existing annual compliance training

High Impact + High Effort = Plan Carefully

These require more work but deliver significant value:

- Integrating IT and Facilities project management for construction
- Embedding technology procurement into enterprise purchasing system
- Incorporating cyber risk into enterprise risk management framework
- Building IT competencies into HR-managed job descriptions and performance system

Low Impact + Low Effort = Fill In Later

These are nice-to-haves that can wait:

- Consolidating IT and enterprise newsletter
- Combining IT and organization social events
- Merging IT and organizational recognition programs

Low Impact + High Effort = Skip

These aren't worth the investment:

- Trying to force-fit IT processes that actually need to be separate
- Integration for its own sake without clear benefit

Focus your energy on the high-impact opportunities. Start with low-effort wins to show value and build momentum, then tackle the more complex integrations.

Implementation Guidance by Organization Size

Integration approaches vary by organizational size:

Very Small Organizations (5–10 IT staff, <100 total employees):

Integration is essential and relatively easy because:

- Fewer formal structures mean less bureaucracy to deal with
- Everyone already knows everyone, use existing relationships
- Can't afford parallel processes, must integrate to survive
- Changes can happen through conversation rather than formal process redesign

Start with:

- Attending all regular management meetings rather than scheduling separate IT meetings
- Using existing procurement processes with simple IT input rather than separate IT procurement

- Embedding security awareness in existing staff meetings rather than separate training
- Discussing projects in existing forums rather than creating IT governance structure

Mid-Sized Organizations (11–30 IT staff, 100–400 total employees):

Integration requires more deliberate design because:

- Some formal structures exist but aren't overly rigid
- Relationships are still manageable but not automatic
- Opportunities exist to influence structure design as organization grows
- Balance between agility and structure

Focus on:

- Embedding IT into existing committee and meeting structures
- Building IT considerations into developing procurement and HR processes
- Establishing IT presence in existing governance forums
- Partnering with other departments on process development rather than building separate IT processes

Larger Organizations (31–150 IT staff, 400–2500+ total employees):

Integration faces more obstacles but is more valuable because:

- Formal structures are entrenched, requires deliberate change
- Many partners means coordination is harder but more necessary
- Efficiency gains from integration are substantial given scale
- Culture change is harder but more lasting

Prioritize:

- Strategic positioning of CIO in existing executive and Board structures
- Systematic integration of technology considerations into enterprise systems (procurement, project management, risk management)
- Formal partnerships with key departments (HR, Procurement, Facilities, Risk)
- Consistent presence in all major governance forums rather than parallel IT governance

Regardless of size, the principle remains: integrate first, separate only when necessary.

How This Connects to the Broader Framework

Integration multiplies everything you've built. When IT processes embed into how the broader organization operates, they stop being "IT things" and become "how we work":

Leadership capabilities from Module 1 are critical for integration:

- Political navigation skills (Section 1.4) are essential for successfully integrating IT into existing power structures and decision-making processes
- Communication abilities (Section 1.5) enable effective participation in diverse organizational forums rather than just IT-focused discussions
- Time prioritization (Section 1.2) lets you invest in relationship-building through regular participation in organizational activities
- Understanding your role (Section 1.1) means seeing yourself as organizational leader who happens to have IT expertise, not IT leader separate from the organization

Organizational health (Module 2) determines integration success:

- Organizational structure (Section 2.3) determines where and how IT can integrate, understanding existing structures is a prerequisite to integration.
- Culture (Section 2.5) either enables or blocks integration, organizations with siloed cultures resist integration; collaborative cultures embrace it
- Your leadership team (Section 2.1) must understand and support integration strategy, not defend separate IT processes
- Communications (Section 2.6) infrastructure provides channels for integrated communication rather than separate IT channels

The governance and strategic structures from Module 3 connect here:

- Governance (Section 3.1) becomes more effective when embedded in existing structures rather than operating completely separately. Note: some governance structures will still need to be separate, but can then be more focused and efficient with less participants. Use these same principles with governance committees when it makes sense to consolidate general, AI, data, and risk governance into the same top level IT governance council.
- Strategic planning (Section 3.2) happens through participation in organizational planning processes rather than separate IT planning
- Services and Products (Section 3.4) requires integration with departments to understand their needs in real-time
- Budget and financial management (Section 3.5) works through existing budget processes rather than parallel IT budgeting

Module 4's service practices provide what you're integrating:

- Business relationship management (Section 4.5) is built on continuous integration rather than episodic engagement
- Knowledge management (Section 4.3) benefits from integration with enterprise knowledge systems rather than separate IT knowledge bases

- Customer service (Section 4.4) improves when IT participates in regular business operations rather than remaining separate
- Portfolio and service management (Section 4.2) aligns with organizational priorities through integration into existing governance

To the rest of Module 5:

- Feedback and engagement (Section 5.1) flow naturally through integrated structures rather than requiring separate IT feedback mechanisms
- Process improvement (Section 5.3) identifies opportunities by participating in business processes rather than observing from outside
- Performance management (Section 5.4) aligns with organizational performance systems rather than using separate IT metrics
- Innovation (Section 5.5) emerges from integrated collaboration rather than IT innovation in isolation

Integration is both enabled by and essential for every other element of the framework. It depends on strong leadership, healthy organization, clear strategy, and excellent service. And continuous improvement requires integration to be sustainable.

Key Takeaways

- IT processes that operate separately from enterprise operations face low compliance, poor engagement, and constant bypass through shadow IT
- Integration means embedding IT requirements into existing organizational structures, workflows, and meetings rather than creating parallel IT-specific mechanisms
- The five key integration areas are: procurement/vendor management, HR/training, risk management/cybersecurity, facilities/construction, and governance/business relationships
- Integration delivers higher compliance, better engagement, reduced shadow IT, stronger relationships, greater efficiency, and real authority
- Meeting math strongly favors integration, using existing meetings with IT agenda items saves hundreds of hours compared to separate IT meetings
- Authority must match accountability, integration embeds IT in organizational accountability structures where real authority exists
- Integration isn't loss of control, it's gaining real influence by being present in structures that matter rather than operating separate structures people can ignore

Reflection Questions

Assess your integration opportunities:

1. What percentage of IT processes currently operate separately from equivalent enterprise processes versus being integrated?

2. Which separate IT process causes the most frustration or avoidance from business partners? What existing organizational process could it integrate with?
3. When was the last time a significant technology decision happened without IT input? Could integration have prevented that?
4. How many hours per year does your organization spend in IT-only meetings? How much could be saved through integration?
5. Does the CIO have a standing seat at regular executive team meetings, or is IT represented only occasionally?
6. What's the biggest barrier to integration in your organization, IT's reluctance to share control, or business units' resistance to IT involvement?
7. If you added up all the separate IT communication channels, governance structures, and processes, how much organizational capacity is being consumed that could be redeployed?

The working documents for this section are in Appendix A.5.2.

Section 5.3

Making Things Better

A CIO's story from a few years ago perfectly captures the challenge of continuous improvement in local government IT.

His team had identified a significant problem: their asset management process was broken. Equipment went missing, purchases were duplicated, disposal wasn't tracked properly, and audit findings were becoming routine. Everyone knew it was a problem. Multiple staff had proposed solutions over the years.

But nothing changed.

When he asked his team why the problem persisted despite broad awareness, he got revealing answers:

"I mentioned it to my supervisor last year, but nothing happened, so I figured leadership didn't think it was important."

"I don't have time to fix it. I'm already working on three projects and handling tickets."

"I assumed asset management was someone else's responsibility. I just handle the technical side."

"I tried to improve our process once, but got pushback because it wasn't 'approved work,' so I stopped."

The problem wasn't lack of awareness or inability. The problem was culture and leadership. The organization hadn't created an environment where continuous improvement was expected, valued, and enabled. Improvement work wasn't "real work", it was something people did on their own time, if at all. Staff didn't believe they had authority to fix problems. There was no clear framework for identifying, prioritizing, and tracking improvement initiatives.

That's the fundamental challenge of continuous process improvement in local government IT: everyone agrees improvement is important, but organizational systems and culture often don't support it happening.

The Leadership Challenge: Making Improvement Real Work

Earlier in this module, we established the cultural foundation for continuous improvement: the 20% principle, feedback mechanisms, employee engagement, and psychological safety. Those elements create the "why" and the willingness.

This section addresses the "how", specifically, how leaders create the organizational framework and environment where continuous improvement occurs. Not tools or methodologies. Leadership establishing the conditions where improvement becomes embedded in how the organization operates.

The core leadership challenges are:

Making improvement work legitimate. If improvement initiatives aren't treated as "real work", scheduled, tracked, resourced, and valued, they won't happen consistently. Leaders must establish that working *on* the business is just as important as working *in* the business.

Enabling every employee to improve. Improvement can't be solely leadership's job or a special team's responsibility. Every employee must feel authorized and expected to identify problems and participate in solutions. This requires clear decision rights and real authority, not just permission.

Creating systematic frameworks. Without structure for capturing, evaluating, prioritizing, and tracking improvement opportunities, good ideas die in email threads or notebooks. Leaders must establish lightweight but consistent frameworks that make improvement systematic rather than random.

Removing obstacles. Even motivated employees in supportive cultures hit barriers: unclear authority, time constraints, conflicting priorities, approval bottlenecks, resource limitations. Leadership's critical role is identifying and systematically removing these obstacles.

Connecting improvement to organizational goals. Random improvement initiatives, no matter how well-intentioned, don't build organizational capability. Leaders must ensure improvement efforts connect to strategic priorities and maturity goals established in Modules 2 and 3.

When leaders do this well, continuous improvement stops being an initiative and becomes how the organization operates. Problems surface quickly, solutions come from the people closest to the work, and the organization develops the muscle memory of getting better.

Why This Matters Now

Local government IT faces accelerating complexity. Technology changes faster. Cybersecurity threats evolve constantly. Citizen expectations rise. Regulatory requirements expand. Staff turnover creates knowledge gaps.

Organizations cannot rely solely on planning and execution anymore, they need adaptability and continuous learning built into their operating model to handle rapid technological changes and market shifts. The pace of change means that processes and approaches that worked last year may be inadequate today.

Organizations that embed continuous improvement into their culture develop competitive advantage through several mechanisms:

Problems get fixed faster. When improvement is everyone's responsibility, issues get identified and addressed before they fester into formal projects.

Better employee engagement. Employees who feel trusted in their roles, including authority to improve processes, are highly engaged in their work, which leads to better organizational results including more creativity, higher productivity, and innovation.

Reduced technical debt. Continuous small improvements prevent the accumulation of workarounds, manual processes, and outdated practices that eventually require expensive remediation.

Organizational learning. Each improvement teaches you something about what works and why. That knowledge accumulates, and over time, future improvements come faster because you're building on what you've already figured out.

Resilience. Organizations that practice change in small increments adapt to disruption more easily, they've built the muscle before the crisis hits.

The alternative, waiting for formal projects to address every problem, creates organizations that are perpetually behind, always catching up but never quite getting ahead.

The Leadership Framework for Enabling Improvement

Creating an environment where continuous improvement thrives requires deliberate leadership action across several dimensions:

1. Establish Clear Decision Rights and Authority

The most common barrier to employee-driven improvement is unclear authority. People don't know what they're allowed to change without permission, so they default to asking for approval or not attempting improvement at all.

Trusted employees are never spectators and can participate in decision-making processes, but this requires clear understanding of where they have authority to act.

Leaders must explicitly define decision rights for improvement work:

Autonomous improvement (no approval needed). These are changes individuals or small teams can make immediately:

- Improving their own work processes and documentation
- Enhancing templates and tools they personally use
- Fixing obvious errors or inconsistencies
- Making their workspace or digital environment more efficient
- Implementing better personal organization methods

Team-level improvement (supervisor approval). These affect multiple people or require coordination:

- Changes to shared team processes
- Updates to team documentation or knowledge bases
- Modifications to team tools or shared resources
- Team workflow adjustments

Department-level improvement (management approval). These have broader impact:

- Changes affecting multiple teams or departments
- Modifications to customer-facing processes
- New tools or technology requiring budget
- Policy or procedure changes
- Changes with security, compliance, or legal implications

Organization-level improvement (governance approval). These require formal decision-making:

- Enterprise-wide process changes
- Significant budget requirements
- Changes affecting organizational strategy
- Major policy revisions
- Projects requiring cross-department resources

Document these decision rights clearly. Share them in team meetings. Reference them when people ask for permission unnecessarily. The goal is creating clarity about where people have authority to act versus where formal approval is needed.

When you establish decision rights, you're not creating bureaucracy, you're creating clarity that enables faster action. Trust requires providing employees with the necessary resources, training, and support to drive improvement initiatives, not just permission.

2. Protect Time for Improvement Work

The 20% principle establishes time for improvement work. But establishing a principle isn't enough. Leaders must actively protect that time against the constant pressure of operational work.

In practice, this means:

Explicitly scheduling improvement work. Improvement initiatives should appear in work management systems, project tracking, and capacity planning just like any other work. If improvement work is invisible in your workload tracking, it will be deprioritized whenever operational pressure increases.

Treating improvement commitments as real commitments. When someone commits to an improvement initiative, that commitment should be honored

the same way you'd honor a project deadline or support obligation. Don't routinely pull people off improvement work for operational issues unless critical.

Adjusting workload expectations. If 20% of time is allocated to improvement work (averaged over quarters), then operational work expectations should reflect 80% capacity, not 100%. Many organizations fail here, they expect 100% operational delivery *plus* improvement work, which makes improvement time fictional.

Making improvement work visible. Include improvement initiatives in team meetings, status reports, and leadership updates. When improvement work is reported alongside operational work, it reinforces that both matter.

Celebrating completed improvements. Recognition shouldn't only go to project completions or technical achievements. Celebrate process improvements, enhanced documentation, better tools, and incremental enhancements. What you celebrate signals what you value.

The cultural message must be clear: improvement work isn't something people squeeze in around "real work." It is real work, vital to organizational health and capability development.

3. Create Systematic Intake and Identification Mechanisms

Good ideas for improvement are everywhere in your organization. The question is whether you have mechanisms to capture, evaluate, and act on them.

Effective improvement frameworks include multiple intake channels:

Structured feedback loops. Regular surveys, retrospectives, and feedback mechanisms systematically surface improvement opportunities. These should feed into a centralized intake process, not just generate discussion.

Standing improvement discussions. Include improvement topics in regular team meetings:

- "What's one thing that frustrated you this week that we could improve?"
- "What process took longer than it should have?"
- "What information did you need that wasn't easily available?"

These simple questions, asked consistently, generate continuous improvement opportunities.

Improvement suggestion system. Provide a simple way for anyone to submit improvement ideas, whether a form, email address, or ticketing category. Make submission frictionless so ideas get reviewed systematically.

Post-project reviews. Every significant project should end with "What would we do differently next time?" These lessons learned should generate improvement initiatives, not just documentation that nobody reads.

Incident and problem analysis. When incidents occur or problems surface, root cause analysis should identify systemic improvements, not just immediate fixes. The improvement that prevents recurrence is often more valuable than the initial resolution.

The common pattern across successful improvement frameworks is *systematic* identification rather than random or occasional. Improvement opportunities shouldn't depend on someone happening to mention something to leadership. There should be regular, predictable ways for opportunities to surface.

4. Establish Evaluation and Prioritization Criteria

Not every improvement idea deserves the same investment. Some deliver big wins for minimal effort; others eat resources for marginal gain. And plenty of good ideas simply don't connect to what matters most right now.

Leaders must provide clear criteria for evaluating improvement opportunities:

Strategic alignment. How does this improvement connect to organizational goals, maturity objectives, or strategic priorities? Improvements that advance strategic goals should generally receive higher priority than those that don't.

Impact assessment. What problem does this solve? How many people are affected? How significant is the pain point? What value is created? High-impact improvements deserve priority over nice-to-haves.

Effort estimation. How much time and resources are required? Can this be accomplished by individuals or small teams, or does it require significant project resources? Quick wins, high impact, low effort, often deserve priority because they build momentum.

Risk evaluation. What could go wrong? What are dependencies? What's required for success? Some improvements, while valuable, carry risks that require careful planning. Others are low-risk and can proceed immediately.

Organizational readiness. Is the organization ready for this improvement? Do we have prerequisite capabilities? Is this the right timing? Some improvements must wait for core work to complete.

Document your evaluation criteria. Train your leadership team to apply them consistently. This prevents arbitrary decision-making and makes sure improvement investments align with organizational priorities.

Don't over-engineer this process for small improvements. Minor enhancements that individuals or teams can implement autonomously don't need formal evaluation, they should just happen. Reserve formal evaluation for improvements requiring significant resources or cross-team coordination.

5. Remove Systemic Obstacles

Even with clear authority, protected time, systematic intake, and good prioritization, improvement efforts still fail when they encounter systemic obstacles. Leadership's critical role is identifying and removing these barriers.

Common obstacles and solutions:

Approval bottlenecks. If every minor change requires multiple approvals, improvement slows to a crawl. Solution: Push approval authority down. Reserve your

approval for significant changes. Trust your team to make good decisions within defined boundaries.

Resource constraints. Many improvements require tools, training, or external support. Solution: Budget for improvement work. Whether it's professional development funds, tool licenses, or consultant support, resources must be available. Continuous improvement should be a standing budget category, not something you try to find money for each time.

Competing priorities. When everything is urgent, improvement work gets perpetually delayed. Solution: Governance provides the approach for balancing operational demands with improvement work. Escalate priority conflicts to governance bodies rather than making ad hoc decisions.

Fear of failure. If people believe failed improvement attempts will be punished, they won't try. Solution: Model learning from failure. When improvements don't work as expected, focus on what was learned and how to adjust, not on blame.

Lack of skills or knowledge. Sometimes people want to improve processes but don't know how. Solution: Provide training in improvement methodologies, basic problem-solving, root cause analysis, process mapping, change management. These don't need to be formal certifications; even brief training enables more effective improvement work.

Technical limitations. Current systems may constrain what's improvable. Solution: The authority principle becomes critical here. If systems limit improvement and you can't change the systems, be transparent about constraints. Don't let people waste energy trying to improve things that current technical architecture won't support.

Organizational inertia. "We've always done it this way" is perhaps the most common obstacle. Solution: This is a culture issue at its root. Leadership must consistently challenge tradition-based arguments and ask, "Is this still the best approach given current conditions?"

Pay attention to patterns. When multiple improvement efforts encounter the same obstacle, that obstacle deserves systematic attention. Don't just solve it for one initiative, solve it organizationally.

6. Model Continuous Improvement Yourself

Leaders must guide their teams through technological changes while maintaining focus on employee well-being and engagement, encouraging work environments that encourage continuous learning and adaptability.

Your behavior as leader sets the standard. If you talk about continuous improvement but don't personally engage in it, your team will recognize the disconnect.

Model improvement by:

Publicly acknowledging your own learning. Share when you've changed your approach based on new information or feedback. "I used to think X, but after

considering Y, I now believe Z." This models that changing positions based on evidence is strength, not weakness.

Seeking feedback on your own leadership. Ask your team for input on how you can improve as leader. Act on that feedback visibly. This demonstrates that everyone, including leadership, should continuously improve.

Implementing your own improvements. Don't just direct others to improve, show your own improvement work. Whether it's enhancing how you run meetings, improving your communication, or simplifying your own processes, make your improvement efforts visible.

Admitting when approaches aren't working. If a leadership decision or organizational approach isn't delivering results, acknowledge it and adjust. Don't persist with ineffective approaches because changing course might appear inconsistent.

Celebrating learning from failures. When initiatives don't work as planned, whether yours or others', focus on what was learned. "Here's what we tried, here's what happened, here's what we learned, here's what we'll do differently." This models the learning orientation essential for continuous improvement.

The message your behavior sends is powerful: we are all learning, we are all improving, and that's expected at every level.

Connecting Improvement Work to Performance Management

The improvements identified, evaluated, and prioritized through this framework must then be tracked and completed.

Think of the relationship this way:

This section creates the environment and framework where:

- Improvement opportunities are systematically identified
- Ideas are evaluated against clear criteria
- Priorities are established based on strategic alignment and impact
- Authority and resources are provided for improvement work
- Obstacles are removed so work can proceed

Performance management (covered next) ensures that:

- Improvement initiatives are formally tracked
- Progress is visible to leadership
- Accountability for completion is clear
- Results are measured and communicated
- Completed improvements are recognized

Without the enabling environment from this section, Performance Management would just be tracking work that struggles to happen. Without the tracking and

accountability from Performance Management, the improvement work identified here might start enthusiastically but fade as priorities shift.

These two sections work hand in hand: leadership builds the environment for improvement, and performance management makes sure improvement work actually gets done.

How This Connects to the Broader Framework

Making things better through continuous improvement doesn't stand alone. It depends on and reinforces multiple elements from earlier modules:

The personal leadership competencies from Module 1 are essential for creating improvement culture:

- Self-awareness (Section 1.3) helps you recognize when your own behaviors might be barriers to improvement
- Political navigation (Section 1.4) provides the skills for securing support for improvement initiatives
- Communication (Section 1.5) enables you to articulate why improvement matters

Culture work from Module 2 is what makes improvement possible:

- Vision and purpose (Section 2.2) connects improvement work to organizational mission. Improvement isn't for its own sake but to better serve citizens and advance mission
- Capabilities and people (Section 2.4) established that development is ongoing, including developing the organization's improvement capabilities
- Culture (Section 2.5) built the psychological safety essential for people to surface problems and experiment with solutions without fear

The connection to culture deserves emphasis: continuous improvement only works in cultures where admitting problems is acceptable, where experimentation is encouraged, where learning from failure is valued. You cannot mandate continuous improvement into existence in a toxic culture.

The strategic direction from Module 3 gives improvement work its framework and focus:

- Governance (Section 3.1) establishes the decision-making structures for prioritizing improvement initiatives, especially those requiring significant resources
- Strategic planning (Section 3.2) articulates organizational maturity goals that improvement work should advance
- Frameworks and standards (Section 3.3) establishes the baseline practices that continuous improvement enhances rather than replaces

Service delivery from Module 4 both drives and benefits from continuous improvement:

- Policies (Section 4.1) improve through hands-on refinement rather than top-down rewrites
- Service management (Section 4.2) depends on continuous improvement to keep delivery processes sharp
- Customer service (Section 4.4) gets better as you reduce friction points

Within Module 5, this section builds on what comes before:

- Feedback and Engagement (Section 5.1) established the cultural foundation and feedback mechanisms: the "why" and the willingness; this section provides the "how" through systematic frameworks and leadership actions
- Performance Management (Section 5.4) will provide the tracking and accountability that helps improvement initiatives complete

None of this stands alone. Sustainable continuous improvement depends on the leadership capabilities, organizational health, strategic alignment, and service orientation built in earlier modules.

Key Takeaways

- Continuous improvement requires deliberate leadership to create the enabling environment; it doesn't happen spontaneously
- Making improvement work "real work", scheduled, tracked, resourced, valued, is essential for long-term viability
- Every employee must be enabled to participate in improvement, with clear decision rights about what they can change autonomously versus what requires approval
- Systematic frameworks for identifying, evaluating, and prioritizing improvements help ensure good ideas don't get lost
- Leadership's critical role is removing obstacles that prevent improvement work from happening
- Improvement initiatives identified through this framework feed into Performance Management (Section 5.4) for tracking and accountability
- Continuous improvement depends on core work in Modules 1–4: leadership capability, organizational health, strategic alignment, and service orientation
- Quick wins build momentum and demonstrate that improvement work produces results

Reflection Questions

Assess your current improvement environment:

1. If you asked your staff whether they believe improvement work is "real work" or something they do on their own time, what would they say?

2. Can your team members articulate what they're authorized to improve without seeking approval versus what requires permission?
3. What happened to the last improvement idea someone on your team proposed? Did it go anywhere, or did it disappear?
4. When operational pressure increases, what happens to improvement work? Does it get protected or immediately deprioritized?
5. What systemic obstacles consistently prevent improvement initiatives from succeeding in your organization?
6. If someone wanted to propose an improvement today, would they know how? Would the process be simple or bureaucratic?
7. When was the last time you personally implemented an improvement to your own leadership approach based on feedback or learning?

The working documents for this section are in Appendix A.5.3.

Section 5.4

Performance Management for Continuous Improvement

I started the journey into systematic performance management the way many of us do, reluctantly.

For years, my IT organization operated informally. People knew what they were supposed to do. Projects got assigned. Work got done. Annual performance reviews happened because HR required them, but nobody found them particularly valuable. Goals, when they existed at all, were vague: "Support the GIS system." "Maintain the network." "Help users."

The organization wasn't failing. But it also wasn't thriving. Employee engagement surveys showed middling results. Turnover was higher than it should be. Strategic initiatives would start with enthusiasm, then fade as operational demands consumed attention. I couldn't articulate with confidence whether the organization was progressing toward any particular vision, because there wasn't a clear, measurable vision to progress toward.

Then something shifted. The organization went through a process of defining its vision, why statement, and core values, real work involving all employees, not just words on a website. They articulated what kind of organization they wanted to be: "Healthy, Effective, and High-Performing."

That vision created a problem: How do you know if you're becoming healthy, effective, and high-performing? How do you measure progress toward those aspirations? How do you ensure that every employee understands how their work contributes to that vision?

Traditional IT performance management, tracking tickets closed, measuring uptime, monitoring project completion rates, couldn't answer those questions. Those

metrics measured operational efficiency, not organizational health or cultural maturity. They were necessary but insufficient.

So we built something different: a performance management system focused not primarily on IT operations, but on organizational development. A system where goals explicitly connected to vision and values. Where behaviors mattered as much as outcomes. Where every employee, from technicians to managers, had documented ownership areas and clear goals connected to the organization they were collectively trying to build.

It wasn't easy. Managers resisted at first, "We're too busy to do all this goal-setting." High performers questioned whether they needed goals when their work was obviously valuable. The technical staff struggled to see how documenting their responsibilities and setting goals would improve anything.

But over time, something remarkable happened. Employees started understanding *why* their work mattered, not just *what* they were doing. Teams began coordinating better because goals were aligned. Continuous improvement initiatives, which previously lived in notebooks and disappeared, now had structure and accountability. Employee engagement scores climbed steadily. Retention improved. The organization was measurably becoming what it aspired to be.

The transformation didn't come from fancy tools or complex methodologies. It came from leadership's commitment to making vision and values measurable, from establishing clear goal cascading from organizational priorities down to individual responsibilities, and from treating organizational maturity as real work worthy of tracking and measuring.

Performance management for continuous improvement works like this: It's not about evaluating past performance, though that happens. It's about building organizational capability and culture deliberately, systematically, and measurably.

Reframing Performance Management

Most IT organizations approach performance management as an evaluation exercise. Once a year (or quarterly if they're progressive), managers assess whether employees met expectations, delivered on commitments, and demonstrated required competencies. The focus is backward-looking: *What did you accomplish?*

This traditional approach serves an important purpose, accountability, differentiation for compensation decisions, documentation for HR purposes. But it does little to build organizational capability or drive cultural transformation.

The performance conversation is shifting, from "What did you do this year?" to "How can we help you grow now?" This shift is strategic. Performance shifts from micromanaging to coaching, enabling, and co-creating success.

Performance management for continuous improvement reframes the entire effort. The primary purpose isn't evaluation, it's development. Not just individual development, but organizational development. The question shifts from "Did you meet your goals?" to "Are we becoming the organization we aspire to be?"

It requires measuring different things:

Traditional IT Performance Management focuses on:

- Operational efficiency (ticket response times, resolution rates, system uptime)
- Project delivery (on time, on budget, meeting requirements)
- Individual productivity (tickets closed, tasks completed)
- Technical competency (skills assessments, certifications)

These metrics answer: *Is IT keeping the lights on and delivering projects?*

Performance Management for Continuous Improvement focuses on:

- Cultural coherence (do people know and live the values?)
- Employee engagement (are people motivated, satisfied, growing?)
- Organizational maturity (are we building capabilities systematically?)
- Strategic progress (are we advancing toward our vision?)
- Continuous improvement execution (are improvement initiatives completing?)
- Behavioral indicators (are we demonstrating desired values through actions?)

These metrics answer: *Are we becoming the organization we want to be?*

The traditional metrics still matter, you can't ignore operational performance. But while KPIs and OKRs still matter, they're no longer enough on their own, as leaders now focus on the why behind the numbers, connecting performance to purpose, outcomes, and impact. For government IT organizations trying to become high-performing, the organizational maturity metrics are more predictive of long-term success than the operational efficiency metrics.

What We Measure Shapes Who We Become

There's a fundamental principle in organizational behavior: Key Performance Indicators impact behaviors in organizations and both incentivize required behavior or disincentivize behavior which is not desired. What you measure and reward is what you get more of.

If you only measure ticket volume, you'll get staff optimized for closing tickets quickly, but not necessarily for solving root problems, improving processes, or building better relationships with customers.

If you only measure project delivery, you'll get projects delivered, but not necessarily knowledge transfer, sustainable solutions, or organizational learning.

If you only measure individual performance, you'll get individual achievement, but not necessarily collaboration, knowledge sharing, or team success.

When KPIs are thoughtfully integrated and coordinated with a company's values and strategic objectives, they can significantly influence employee behavior, drive performance, and enhance overall organizational health, building a results-

driven environment where employees understand their contributions to company goals.

The shift from traditional IT metrics to organizational maturity metrics matters for a specific reason: You're not just changing what you measure, you're changing what behaviors and outcomes your organization will pursue.

Consider two IT departments in similar-sized local governments:

Department A measures primarily: tickets closed, average response time, system uptime, project completion rates.

Department B measures: employee engagement scores, goal synchronization rates, continuous improvement completion, customer satisfaction, service ownership quality, values demonstration, knowledge sharing frequency.

Five years later, Department A runs efficiently. Systems work. Projects deliver. But staff turnover is high, innovation is rare, customer relationships are transactional, and the organization hasn't materially improved its capabilities.

Department B has become a high-performing organization. They still deliver operations and projects, but they've also built strong culture, developed deep employee engagement, earned organizational trust, established service ownership throughout the team, and continuously improved their capabilities. They're not just doing IT work, they're building organizational excellence.

The difference? What they chose to measure and manage.

The Philosophical Foundation

Performance Management as Organizational Development

In the previous section, we established how leaders create the environment where continuous improvement can occur. We discussed how to identify improvement opportunities, enable employees to act, remove obstacles, and establish frameworks for generating improvement initiatives.

Performance management is what makes sure all that work happens and produces results.

Think of the relationship this way:

The previous section builds the environment:

- Improvement is valued as real work
- Authority and accountability are matched, people have the decision-making power needed to deliver on what they own
- Frameworks exist for identifying opportunities
- Obstacles are removed systematically
- Every employee feels trusted to improve

This section creates the accountability:

- Improvement initiatives are tracked

- Progress is visible and reported
- Goals connect improvement work to organizational priorities
- Results are measured and celebrated
- Incomplete work gets attention and support

Without the cultural foundation, performance management becomes bureaucratic tracking divorced from cultural reality. Without performance management's accountability, the enabling environment produces enthusiasm but inconsistent results.

Performance management for continuous improvement means treating organizational development work, building culture, improving processes, developing capabilities, advancing maturity, with the same rigor and visibility you give operational delivery. It means establishing goals, tracking progress, measuring outcomes, and holding people accountable for working **on** the organization, not just **in** the organization.

The Authority-Accountability Principle in Performance Management

Effective performance management requires that authority matches accountability at every level. This principle shows up in three critical ways:

First, goal-setting must align with decision authority. Don't assign someone a goal to improve service quality if they lack authority to change processes, allocate resources, or make service decisions. Don't hold a manager accountable for team performance if they can't make staffing, development, or work prioritization decisions. Goals should reflect what people can control or significantly influence given their authority.

Second, measurement systems must reflect ownership boundaries. If you hold the infrastructure team accountable for system uptime, they must have authority over maintenance windows, vendor relationships, and architecture decisions that affect reliability. If you hold the service desk accountable for customer satisfaction, they need authority to resolve issues, escalate effectively, and influence service delivery approaches. Measuring people on outcomes they can't control destroys accountability rather than creates it.

Third, organizational structure must support performance expectations. If you expect managers to develop their teams, your structure must give them time and resources for coaching. If you expect employees to drive improvement, your structure must provide them authority to experiment and implement changes. Performance expectations that your organizational structure makes impossible to achieve aren't performance management, they're setup for failure.

When authority and accountability are mismatched in performance management, several dysfunctions emerge: People game metrics they can control to avoid blame for outcomes they can't. Managers abdicate accountability because "I

can't make them do it." High performers leave because they're measured on things outside their control. The organization blames individuals for systemic problems.

Getting this right means asking, for every goal and metric: "Does this person have the authority to significantly affect this outcome? If not, either give them the authority or change the goal."

Client-Centric vs. IT-Centric Metrics

A critical distinction in performance management philosophy is whose perspective your metrics reflect.

IT-centric metrics measure what matters to IT operations:

- Number of tickets processed
- Average handle time per ticket
- Percentage of changes completed successfully
- System availability percentage
- Project completion rates

These metrics help IT manage internal operations. They're useful for capacity planning, workload management, and operational efficiency.

But they don't necessarily reflect what customers experience or value.

Client-centric metrics measure what matters to the people IT serves:

- How quickly their problems get resolved (not just responded to)
- How easy it is to get help when needed
- Whether services meet their business needs
- How satisfied they are with IT partnership
- Whether IT enables them to do their work effectively

A department can have excellent IT-centric metrics (high ticket volume, fast handle times, strong uptime) while customers feel frustrated, unsupported, and disconnected from IT.

The balance between setting objectives and assessing what employees accomplish and how they go about their work is central to modern performance management, as reviews traditionally used KPIs concentrating on quantifiable metrics and specific targets.

For continuous improvement-focused performance management, client-centric metrics should dominate. You're not optimizing IT operations for IT's convenience, you're building an organization that serves its community and customers exceptionally well.

It doesn't mean abandoning IT-centric metrics entirely. You need to manage operations. But when you establish organizational goals, when you set team and individual objectives, when you decide what to celebrate and reward, client-centric and organizational maturity metrics should drive the conversation.

Balancing "What" and "How"

Modern performance management requires balancing two dimensions:

"What" = Outcomes and Results

- Goals achieved
- Projects delivered
- Services improved
- Problems solved
- Objectives accomplished

"How" = Behaviors and Values

- Collaboration demonstrated
- Values lived consistently
- Knowledge shared without being asked
- Others supported and developed
- Culture strengthened

Traditional performance management focused almost exclusively on "what." If you delivered results, how you delivered them mattered less. This created cultures where high performers could be terrible colleagues, where individual achievement trumped team success, where shortcuts undermined long-term sustainability.

A balanced set of KPIs covers both quantitative outcomes and qualitative behaviors. Peer reviews, customer feedback, and self-assessments make sure that tangible results get rewarded and the behaviors that drive long-term success also get recognized.

For building high-performing IT organizations in local government, the "how" deserves primary emphasis, roughly 75% of performance focus on behaviors and values, 25% on outcomes.

Why this imbalance?

Outcomes are relatively easy to measure and track. Did the project finish? Did the ticket close? Did the goal complete? These are binary or easily quantifiable.

Behaviors are harder to observe and assess, but they're what create lasting culture. An employee who achieves goals while undermining colleagues, hoarding knowledge, or acting inconsistently with values damages organizational health even while producing individual results.

Behaviors are leading indicators of future performance. Employees who collaborate well, share knowledge, support others, and live organizational values will deliver better long-term outcomes than those who achieve short-term results through unsustainable approaches.

In small teams, relationships and culture matter enormously. A 15-person IT team cannot afford toxic high performers. The damage they cause to culture, morale, and collaboration far exceeds their individual contributions.

This doesn't mean ignoring outcomes. Results matter. But in the tension between "excellent results achieved through poor behaviors" and "good results achieved through exemplary behaviors," the latter better serves organizational health.

Practically, this means:

- Goals include both outcome objectives and behavioral objectives
- Performance discussions address both what was accomplished and how it was accomplished
- Recognition celebrates values demonstration as prominently as achievement
- Development plans address behavioral growth alongside skill development
- Promotion and advancement criteria explicitly include values connections

The message must be clear: *How* you accomplish goals matters as much as *what* you accomplish.

Making Vision, Values, and Culture Measurable

The biggest challenge in performance management for continuous improvement is translating abstract aspirations into concrete, measurable indicators.

If your organization's vision is "We are a Healthy, Effective, High-Performing Organization" (as in the example from the opening), how do you measure that? Health, effectiveness, and high performance are concepts, not metrics.

The process requires breaking down aspirational statements into observable behaviors and measurable outcomes:

Vision: "Healthy Organization"

- Observable behaviors: People admit mistakes without fear, collaborate across boundaries, support each other's success, communicate openly, maintain work-life balance
- Measurable indicators: Employee engagement survey scores, retention rates, 1:1 meeting completion, recognition frequency, psychological safety assessments

Vision: "Effective Organization"

- Observable behaviors: Goals align across levels, priorities are clear, resources match commitments, decisions happen efficiently, coordination works smoothly
- Measurable indicators: Goal connection percentages, strategic plan execution rates, project success rates, cross-team collaboration frequency, decision cycle times

Vision: "High-Performing Organization"

- Observable behaviors: Continuous improvement is norm, excellence is expected and celebrated, accountability is clear, capabilities grow systematically, results consistently achieved
- Measurable indicators: Continuous improvement completion rates, capability maturity scores, stakeholder satisfaction, service quality metrics, performance goal achievement

This translation from vision to behaviors to metrics is essential work, typically done by leadership team collaboratively. The metrics you choose become your operational definition of success.

Two critical principles:

1. Lead with behaviors, follow with metrics. Don't start with "What can we easily measure?" Start with "What behaviors would demonstrate we're living our vision?" Then figure out how to measure those behaviors.

2. Accept imperfect measurement. Some important behaviors resist quantification. Psychological safety, for instance, is difficult to measure precisely. Don't abandon measuring it just because it's hard, use proxy indicators (like willingness to admit mistakes or raise concerns) alongside survey data. Imperfect measurement of the right thing beats precise measurement of the wrong thing.

Performance management now makes those aspirations operational and trackable.

Goal Frameworks for Alignment

The Cascading Goal Architecture

The power of performance management for continuous improvement comes from creating connections, so that work at every level connects to and advances organizational priorities.

Team and organizational goals get set first. Those broader goals then guide individual objectives, so individual contributions connect to collective success.

The alignment architecture looks like this:

Level 1: Organizational Maturity Goals These are top-level goals that define what kind of organization you're building. They flow directly from your vision and values.

Examples:

- "Employee culture is pervasive as designed" (Everyone knows and aligns with vision, why, values)
- "Employee satisfaction and engagement is outstanding" (High engagement scores, strong work-life balance, clear ownership)
- "We are a high-performing organization" (HPO methods embedded, systematic improvement, excellent execution)
- "Strategic and fiscal planning is comprehensive" (Clear plans, aligned resources, stakeholder input)
- "Our stakeholders are elated with us" (High satisfaction, strong partnerships, valued services)

Level 2: Department/Team Goals These are goals that show how each team or functional area will contribute to organizational maturity goals.

Example: If organizational goal is "Employee culture is pervasive as designed," department goals might include:

- IT Operations: "All operations staff can articulate how their services connect to organizational mission"
- Applications Team: "Service ownership is established for all applications with documented responsibilities"
- Support Team: "Customer interaction behaviors consistently demonstrate our service values"

Level 3: Individual Employee Goals These are specific objectives that show how each employee will contribute to their team's goals and, through that, to organizational goals.

Example: If team goal is "Service ownership established for all applications," individual goals might include:

- Network Administrator: "Document network services, establish service levels, create quarterly improvement goals for network reliability"
- GIS Specialist: "Own GIS services with documented responsibility areas, establish user feedback mechanism, complete three GIS service improvements"

This cascading creates coherence. Everyone understands how their work connects to something larger. Shared purpose, too: we're not just doing jobs, we're collectively building an organization. And leaders gain visibility, because goal achievement across levels shows them real organizational progress.

Alignment vs. Rigid Cascading

A critical distinction in goal frameworks is the difference between *alignment* and *rigid cascading*.

Rigid cascading means higher-level key results become lower-level objectives mechanistically. The CEO's key results become the VPs' objectives, which become the directors' objectives, which become employees' objectives. Every goal flows directly and linearly from the level above.

Many experts now warn against rigid cascading, as it can create more complexity than needed, marginalize contributors, resist fast goal-setting, and result in overly prescriptive top-down goals that hamper bottom-up creativity.

Alignment means goals at every level support and connect to organizational priorities, but not necessarily in linear fashion. Teams have autonomy to determine *how* they'll contribute to organizational goals based on their expertise and circumstances.

While cascading isn't the goal, alignment is, company goals should represent top priorities, and each team should contribute where possible, with objectives functioning more like a graph or web than a strict hierarchy.

For small to mid-sized government IT organizations, **alignment is the better approach**:

- It respects team expertise (they know best how to contribute)
- It allows flexibility as circumstances change
- It enables bottom-up innovation alongside top-down priorities
- It's faster and more sustainable
- It maintains focus on outcomes rather than process

Make organizational goals visible and clear, then trust teams to develop their own goals that actually support those priorities.

Framework Options for Goal Management

Several frameworks exist for structuring organizational goals. Here are the primary options:

1. Objectives and Key Results (OKRs)

OKRs help define the "what" and the "how" while your vision enforces the "why," with objectives being significant, action-oriented, inspirational goals strategically connected to organizational vision, and key results being specific, measurable outcomes used to track achievement.

Structure:

- Objective: Qualitative goal (what you want to achieve)
- Key Results: 2–5 quantitative measures (how you'll know you achieved it)

Example:

- Objective: Build a high-performing IT culture
- KR1: Employee engagement survey score reaches 90%
- KR2: 100% of staff can articulate our vision and values
- KR3: Complete 20 team-initiated improvement projects
- KR4: Achieve 95% monthly 1:1 meeting completion rate

Strengths:

- Clear separation between aspirational goals and measurable results
- Promotes ambitious objectives while maintaining accountability
- Widely understood methodology with extensive resources
- Scales well from small to large organizations

Considerations:

- Can feel overly structured for very small teams (5–10 people)
- Requires discipline to avoid cascading too rigidly
- Risk of making key results too operational rather than strategic

Other approaches include the Balanced Scorecard (organizing goals across stakeholder, service, capability, and innovation perspectives) and simple goal cascading (3–5 organizational priorities flowing to team and individual goals). Both

can work, but OKRs provide the best balance of structure and flexibility for local government IT.

Recommended Approach for Local Government IT

Based on experience with local government organizations ranging from 5 to 150 IT staff, here's the recommended approach:

Use OKR framework with flexible connections (not rigid cascading):

1. **Establish 3–5 organizational maturity objectives** that define what kind of organization you're building

2. **Define clear key results** for each organizational objective that make success measurable

3. **Trust teams to create their own OKRs** that support organizational objectives, giving them autonomy in how they contribute

4. **Support individual employee goal development** that connects to team OKRs while also including:

- Specific service/product ownership goals
- Continuous improvement initiatives
- Personal professional development goals (not required to align to org objectives, this is about individual growth)

5. **Use performance management system** (software platform) to track goals, maintain visibility, and support regular review

This approach provides enough structure so that you coordinate while maintaining flexibility for teams to innovate and adapt.

Critical Success Factors

Regardless of which framework you choose, certain factors determine success:

1. Every Employee Has Documented Goals and Ownership

This is non-negotiable for building organizational maturity. Every employee, from newest technician to CIO, should have:

- Documented goals in the performance management system
- Clear ownership areas (specific services, products, or responsibilities they're accountable for)
- Understanding of how their work connects to organizational priorities

This embodies the entrepreneurship principle: every employee takes ownership, not just executes tasks assigned by others. Trusted employees are never spectators and can participate in decision-making processes, with employee ownership of work giving them the power to make decisions, take action and solve problems.

2. Authority Matches Accountability

A persistent theme throughout this framework: don't hold people accountable for outcomes they can't influence.

If an employee has a goal to improve a service, they must have authority to make improvements within defined boundaries. If a team has a goal to implement new capabilities, they must have budget and decision-making authority to do so.

When authority and accountability mismatch, when people are accountable for results they can't control, you create frustration, disengagement, and cynicism about performance management.

Review your goals explicitly: For each goal assigned, does the person/team have authority to achieve it? If not, either provide authority or adjust the goal.

3. Goals Mix Organizational Maturity AND Personal Development

A balanced goal set for an employee includes:

- **Organizational maturity goals** (connect to team/organizational objectives)
- **Service ownership goals** (improving specific services/products they own)
- ***Continuous improvement initiatives***
- **Personal development goals** (building skills, expanding capabilities, career growth)

The personal development goal is important and should NOT be required to align to organizational objectives. People need space for individual growth that interests them, even if it's not immediately applicable to current organizational priorities.

Someone might want to learn a new programming language, pursue a certification, develop presentation skills, or explore an emerging technology. Support this growth. It builds capability that eventually benefits the organization, and it demonstrates you value people's development, not just their utility to current goals.

4. Goals Are Living Documents, Not Annual Artifacts

Traditional performance management creates goals in January, reviews them in December, and ignores them in between.

For continuous improvement, goals must be **living documents**:

- Reviewed in monthly 1:1 meetings
- Updated regularly as circumstances change
- Adjusted when priorities shift or obstacles emerge
- Tracked continuously, not just at year-end

Performance management is shifting from rigid annual reviews to structured, real-time feedback focused on both performance and well-being, with continuous feedback encouraging better communication, faster course correction, and stronger employee engagement.

That requires discipline and systems support. Without a performance management platform, maintaining this continuous cycle is difficult. With appropriate systems, it becomes sustainable.

5. Bottom-Up Input Shapes Goals

While organizational objectives typically come from leadership (top-down), the specific goals that support those objectives should involve significant bottom-up input.

Employees closer to the work often see opportunities and approaches leadership doesn't. Team members know which improvement initiatives are most valuable. Frontline staff understand customer needs most directly.

Create space for bottom-up goal development:

- "Given our organizational objective of improving stakeholder satisfaction, what goals do you think would have most impact?"
- "What improvements to your services would create the most value?"
- "What capability would you like to develop that would benefit both you and the organization?"

Goals people help create are goals people commit to achieving. Goals imposed from above are goals people comply with minimally.

The Performance Management System Components

A functional performance management system requires several integrated components. These aren't separate initiatives, they're interconnected elements of a coherent system.

Component 1: Goal Setting and Alignment

The Process:

Step 1: Establish Organizational Maturity Objectives (Leadership Team)

The IT leadership team (CIO plus direct reports, possibly including key managers) establishes 3–5 top-level objectives that define organizational development priorities for the year.

These should flow from:

- Vision and values
- Strategic priorities
- Known gaps or challenges in organizational health
- Stakeholder needs and feedback

Example objectives:

- "Build an employee culture connected to our vision and values"
- "Establish service ownership across all IT services"
- "Achieve high employee engagement and satisfaction"
- "Deliver consistent service excellence to stakeholders"
- "Systematically improve organizational capabilities"

For each objective, define 2–5 key results that make success measurable.

Step 2: Department/Team Goal Development (Managers with Teams)

Each team or functional area develops their own objectives that support organizational objectives.

This is NOT mechanical cascading (turning organizational key results into team objectives). This IS collaborative coordination:

- Manager shares organizational objectives with team
- Team discusses: "How can we best contribute to these priorities given our responsibilities and expertise?"
- Team develops 2–4 objectives that actually support organizational goals
- Manager guides, ensures alignment, but team significantly shapes content

This process builds ownership and surfaces creative approaches leadership might not have considered.

Step 3: Individual Goal Development (Manager with Each Employee)

In 1:1 discussions, manager and employee collaboratively develop individual goals:

Start with service ownership: "What services/products are you responsible for? What goals will improve those services this year?"

Connect to team objectives: "Our team's objective is X. What goals can you own that contribute to that?"

Incorporate improvement initiatives: "What initiatives are you leading or contributing to?"

Add personal development: "What do you want to learn or develop this year for your professional growth?"

The result: Each employee has 3–7 goals covering these dimensions, documented in the performance management system.

Timeline Considerations:

For organizations new to this approach, expect initial goal setting to take 2–3 months:

- Month 1: Leadership establishes organizational objectives
- Month 2: Teams develop team objectives
- Month 3: Individual goals finalized

This feels slow, but the collaborative development is essential for buy-in. In subsequent years, with the framework established, goal setting compresses to 4–6 weeks or less.

Integration Points:

This goal-setting process must integrate with:

Organizational objectives should advance strategic plan priorities. Your strategic roadmap informs which maturity goals matter most this year.

Service ownership goals should be specific to the services in your portfolio. Use your service catalog and portfolio understanding to assign clear ownership.

Continuous improvement initiatives become goals tracked here. The improvement intake process generates candidates for goal inclusion.

The goal-setting process doesn't exist in isolation, it's informed by and connected to strategic priorities, service portfolio, and improvement pipeline.

Component 2: Regular 1:1 Meetings as Core Practice

The single most important component of effective performance management is **regular, structured 1:1 meetings** between managers and each direct report.

1:1 meetings function as leading indicators of organizational health, when managers consistently conduct quality 1:1s, employee engagement naturally increases as individuals feel valued and supported.

Minimum Standard: Monthly 30-minute 1:1s

Every employee should have at least one 30-minute 1:1 meeting with their direct manager every month. This isn't optional or "when we have time", it's a core management practice, scheduled and protected.

Agenda for 1:1 Meetings:

Goal Progress Review (10 minutes):

- What progress have you made on your goals?
- What's on track? What's behind?
- Do goals need adjustment based on changed circumstances?
- Update goal status in performance management system

Obstacles and Support (10 minutes):

- What's blocking your progress?
- What support do you need from me or others?
- Are there resource, authority, or approval issues preventing goal achievement?
- How can I help remove obstacles?

Development and Feedback (5 minutes):

- How are you progressing on personal development goals?
- Any learning opportunities or growth areas to discuss?
- Feedback on recent work (both recognition and constructive)

Open Discussion (5 minutes):

- Anything else on your mind?
- Team issues, organizational concerns, ideas for improvement?
- Connection back to vision and values

Critical Practices:

Manager prepares. Review the employee's goals before the meeting. Don't walk in cold.

Employee owns agenda. They should come prepared to discuss their progress and needs. This shouldn't be manager talking at employee.

Document key points. Use performance management system to capture discussion notes, decisions made, commitments from both parties.

Follow through. If manager commits to help remove obstacle or secure resource, follow through visibly. Nothing undermines 1:1s faster than manager making commitments that disappear.

Make it routine. Same day/time each month if possible. When 1:1s are predictable, both parties prepare better.

For very small teams (CIO with 3–5 direct reports), weekly or bi-weekly 1:1s may be practical and valuable. For larger teams (manager with 8–12 reports), monthly is minimum, with ad-hoc check-ins between formal 1:1s as needed.

Connection to Feedback Culture:

These 1:1s build on the feedback mechanisms. They're the primary channel for ongoing performance feedback, both recognition and developmental. Annual performance reviews should contain no surprises because continuous feedback happens in 1:1s.

Tracking Completion:

Monitor 1:1 completion rates as organizational health indicator. If certain managers consistently skip or postpone 1:1s, that's a warning sign requiring leadership attention. High-performing organizations maintain 90%+ completion rates for scheduled 1:1s.

Component 3: Tracking and Visibility

Goals must be visible, to employees, managers, and organizational leadership. Visibility creates transparency, enables coordination, and builds accountability.

For organizations with more than 10 employees, invest in a performance management platform that supports goal documentation with visual hierarchy, progress tracking with status indicators, dashboards for leadership and team views, 1:1 meeting agendas and notes, and peer recognition. Prioritize usability and integration with your existing tools over feature richness. The best system is one your team actually uses. For very small teams, a shared spreadsheet with calendar reminders for 1:1s can prove value before you invest in dedicated software.

Component 4: Recognition and Feedback Loops

Performance management creates culture through what you recognize and celebrate.

Peer-to-Peer Recognition:

Your performance management system should enable employees to recognize each other for:

- Living organizational values
- Going above and beyond
- Helping colleagues
- Delivering excellent service
- Contributing to improvements
- Demonstrating desired behaviors

This shouldn't require manager approval or formal process, it should be as easy as sending a quick message: "Shout out to Jane for helping me troubleshoot that network issue when she didn't have to. Great collaboration!"

Manager Recognition:

Managers should regularly recognize employees in 1:1s, team meetings, and via the performance management system for:

- Goal achievement and progress
- Behaviors that exemplify values
- Service excellence
- Improvement initiatives
- Supporting teammates

Public recognition (visible to broader team or organization) is more powerful than private recognition, though both matter.

Recognition Frequency as Leading Indicator:

Recognition frequency is a leading indicator of cultural health. Regular acknowledgment of contributions creates a culture where people feel valued, which correlates strongly with engagement and retention.

Track recognition activity:

- How often are employees recognizing peers?
- How often are managers recognizing direct reports?
- Which teams/individuals are most active in giving recognition?
- What behaviors/values are most frequently recognized?

Healthy organizations show consistent recognition activity. Low recognition frequency signals cultural problems worth investigating.

Continuous Feedback vs. Annual Reviews:

Traditional approach: One big performance review annually, minimal feedback between.

Modern approach: Continuous feedback in 1:1s and real-time, with annual review being just a summary and formalization of ongoing discussions.

The shift toward continuous feedback means feedback happens frequently, goals stay flexible, and recognition is timely rather than saved for year-end ceremonies.

The annual review shouldn't contain surprises. If someone is learning for the first time in December that they're not meeting expectations, management has failed. Ongoing feedback means issues are addressed when they emerge, recognition happens continuously, and the annual review documents and formalizes what's already been discussed throughout the year.

Feedback Quality:

Both recognition and developmental feedback should be:

- **Specific:** Not "good job" but "your thorough documentation of the new process will help others tremendously"
- **Timely:** Close to the behavior or achievement, not weeks later
- **Behavior-focused:** What they did, not who they are
- **Actionable:** (for developmental feedback) What specifically to do differently

Building the feedback muscle, both giving and receiving, takes time. Many managers and employees need coaching and practice. The performance management system can support this with prompts, templates, and examples.

Key Performance Indicators That Matter

Now we address what to measure. Remember the philosophy: organizational maturity and culture indicators should be your primary focus (~90% of emphasis), with traditional IT operational metrics acknowledged but not dominant (~10%).

Organizational Maturity KPIs *(Primary Focus)*

These indicators measure whether you're building the organization you aspire to be:

The KPIs organize into five categories.

1. Cultural pervasiveness indicators tell you whether vision and values are actually taking hold. Can employees articulate the vision? Are management practices happening consistently? Do individual goals connect to organizational objectives?
2. Employee engagement indicators track workforce health, engagement surveys, 1:1 completion rates, recognition frequency, retention trends.
3. High performance organization indicators measure whether you're building capability systematically: goal completion rates, improvement initiative throughput, employee-driven improvement suggestions.

4. Strategic alignment indicators confirm that work advances organizational priorities, strategic plan execution rates and capacity aligned to strategic goals.
5. Stakeholder satisfaction indicators tell you whether customers value what you deliver: satisfaction surveys, problem resolution time, partnership quality assessments from department heads.

Start with 3–5 KPIs from the categories that matter most for your current maturity level and expand as your performance management capability grows.

Traditional operational KPIs: system uptime, incident response time, change success rate, ticket volume, project delivery, security incident frequency still matter for day-to-day management. But they don't differentiate high-performing organizations from mediocre ones. The organizational maturity KPIs do that. You want a balanced mix: leading indicators (1:1 completion rates, recognition frequency, improvement suggestion volume) that predict where you're headed, and lagging indicators (engagement surveys, turnover, satisfaction scores) that confirm what actually happened. Watch the leading indicators monthly. They give you time to intervene before problems show up in the lagging metrics.

Implementation Approach

Moving from informal or traditional performance management to this systematic, continuous-improvement-focused approach requires careful implementation.

Roll out in phases: start with your leadership team (months 1–3) to prove the approach and work out kinks, expand to all managers (months 4–6) so they experience the process before leading it with their teams, then roll out to all employees (months 7–12). Year two focuses on refinement and deeper integration with strategic planning and portfolio management.

Expect resistance. "We're too busy for this" is the most common objection, address it by framing performance management as the work, not extra work. "This feels like bureaucracy" signals you need to demonstrate value through early wins before expanding. Model adoption from the top: if leadership doesn't visibly use the system, nobody else will either. The culture change skills apply directly here, you're changing how people experience accountability and development.

Scaling to Your Team Size

The principles stay constant; the implementation scales. A 5–10 person team can start with a simple spreadsheet, 3–5 organizational goals, and direct CIO-to-staff 1:1s. At 10–30 staff, a dedicated platform becomes valuable and a manager layer emerges. At 30–150 staff, full goal cascading, analytics, and potentially dedicated administrative support are warranted. Start simple and add complexity only as needed, a simple system fully adopted beats a complex system partially ignored.

Sustainability comes from establishing predictable rhythms: monthly 1:1s at the individual level, monthly goal progress discussions at the team level, and quarterly organizational reviews. Performance management must become routine, not special.

Avoiding Common Pitfalls

Pitfall 1: Goals as Punishment

Problem: Using goals to document everything someone did wrong, setting impossible goals as "stretch targets," weaponizing performance management.

Solution: Goals should be developmental and aspirational. Mix of challenging and achievable. Focus on growth, not punishment.

Pitfall 2: Cascading Delays

Problem: Waiting for top-level goals before allowing any other goal-setting, causing months of delay.

Solution: Use alignment, not rigid cascading. Once organizational priorities are clear, teams can develop goals simultaneously rather than sequentially.

Pitfall 3: Metric Gaming and Perverse Incentives

Problem: People optimize for metrics in ways that harm actual performance (example: closing tickets quickly without solving problems to improve "resolution time").

Solution: Balance quantitative and qualitative measures. Measure both outcomes and behaviors. Review metrics regularly for unintended consequences.

Pitfall 4: Set and Forget

Problem: Creating goals in January, ignoring them until December review.

Solution: Monthly 1:1s force regular attention. Goals that aren't reviewed regularly become irrelevant.

Pitfall 5: Too Complex for Small Teams

Problem: Implementing enterprise-scale performance management in 10-person team.

Solution: Right-size the approach. Small teams need simple, lightweight processes, not corporate bureaucracy.

Pitfall 6: No Accountability for Completion

Problem: Goals exist but there's no real consequence for not achieving them, so they're ignored.

Solution: This doesn't mean punishment. It means: goals inform development plans, advancement decisions, and resource allocation. High performers who consistently achieve goals get opportunities. Chronic non-achievers get attention and support to improve or transition.

Pitfall 7: Isolation from Other Systems

Problem: Performance management exists separate from strategic planning, portfolio management, budget, and continuous improvement.

Solution: Actively integrate. Strategic priorities inform goals. Portfolio management assigns service ownership. Budget aligns to goals. Continuous improvement initiatives become goals. It's one interconnected system.

How This Connects to the Broader Framework

Performance management is where the entire framework becomes measurable. It connects individual goals to organizational strategy and makes improvement visible:

Effective performance management starts with your Module 1 leadership capabilities:

- Self-leadership (Section 1.1) gives you discipline to model good PM practices
- Political skills (Section 1.4) help you secure buy-in and resources for PM implementation
- Communication (Section 1.5) is how you explain why PM matters and push through resistance

PM only works in a healthy culture from Module 2:

- Vision and values (Section 2.2) are what PM makes measurable
- People development (Section 2.4) is ongoing. PM is how you track it
- Culture (Section 2.5) provides the psychological safety that makes goal discussions honest rather than performative
- Communications (Section 2.6) get reinforced through 1:1s and recognition

Strategic clarity from Module 3 provides direction for PM goals:

- Governance (Section 3.1) prioritizes which goals matter most
- Strategic planning (Section 3.2) gives you the multi-year direction that annual objectives should trace back to
- Frameworks (Section 3.3) set the maturity targets PM tracks
- Services and products (Section 3.4) ground your metrics in real business needs

Service delivery from Module 4 becomes measurable through PM:

- Policies (Section 4.1) set governance that PM monitors
- Portfolio management (Section 4.2) creates documented accountability through service ownership
- Knowledge management (Section 4.3) becomes specific goals
- Customer service (Section 4.4) quality becomes measurable
- Business relationships (Section 4.5) are assessed for whether partnerships are deepening

Earlier in Module 5:

- Feedback and Engagement (Section 5.1) established the cultural foundation where continuous improvement is valued. PM operationalizes those concepts
- Making Things Better (Section 5.3) created the framework for identifying and prioritizing continuous improvement initiatives. PM tracks those initiatives to completion

PM makes your organizational aspirations operational. The vision from Section 2.2 becomes measurable objectives, values become observable behaviors, and culture becomes data: engagement scores, retention rates, collaboration frequency.

Key Takeaways

Performance management for continuous improvement emphasizes organizational maturity and cultural development (~90% of focus) over traditional IT operational metrics (~10%).

Client-centric metrics (what customers experience) matter more than IT-centric metrics (what IT tracks internally).

Balance outcomes ("what") with behaviors ("how"), weighting behaviors more heavily (75/25) because they are leading indicators and create lasting culture.

Every employee needs documented goals, service ownership, and authority matched to their accountability. Don't hold people accountable for outcomes they can't influence.

Monthly 1:1s are the single most important PM practice. They serve as the primary feedback channel and the strongest leading indicator of organizational health.

Measure organizational maturity through leading indicators (1:1 completion, recognition frequency, improvement submissions, engagement signals) so you can manage ahead of problems rather than react to lagging indicators.

Performance management operationalizes the rest of the framework, strategic planning, continuous improvement, service excellence, culture building, through a sustainable monthly rhythm that survives the year.

Reflection Questions

Before proceeding, assess your current state and readiness:

1. Can you clearly articulate what kind of organization you're trying to build? What would success look like in measurable terms?
2. What do you currently measure about your IT organization? Are those metrics primarily operational/efficiency focused, or do they measure organizational health and cultural maturity?
3. If you asked your staff whether they understand how their work connects to broader organizational goals, what percentage could articulate that connection?

4. How often do your managers conduct structured 1:1 meetings with direct reports? Are those meetings valuable developmental conversations or administrative checkboxes?
5. What percentage of your organizational capacity is spent on continuous improvement vs. operational delivery? Is that allocation intentional and visible, or invisible and ad hoc?
6. When you recognize or celebrate employees, what behaviors and achievements get attention? Does your recognition pattern align with the culture you want to build?
7. How would you know if your organizational culture is improving? What evidence would demonstrate progress toward your vision?
8. Do your employees have clear service ownership and documented goals, or are responsibilities ambiguous and goals vague?
9. If strategic priorities shift mid-year, how quickly could you realign organizational work to those new priorities? What systems enable or prevent agility?
10. What happens when employees achieve their goals? What happens when they don't? Do consequences (positive or negative) align with espoused values about development and accountability?

The working documents for this section are in Appendix A.5.4.

Section 5.5

Innovation Leadership

A CIO I know well learned a hard lesson about experimentation the expensive way.

Several years ago, his organization decided to "get serious about new ideas." The approach seemed logical: create a dedicated team focused on emerging technology. They hired a few sharp technologists, gave them a separate budget, set them up in a different office space, and told them: "Your job is to explore. Find emerging technologies. Pilot new solutions. Be our engine for fresh thinking."

The team was excited. They dove into emerging technologies, IoT sensors for facility management, AI for predictive analytics, blockchain for records management, AR/VR for training. They attended conferences, built proofs-of-concept, and generated impressive demonstration projects.

Meanwhile, the rest of the IT department kept the systems running, responded to tickets, managed projects, and handled daily operations. They were the "operations people" while the new team was doing "the cool stuff."

The problems emerged gradually, then cascaded:

The class system developed. Operations staff resented the new team. "We're buried in work keeping systems running, and they get to play with toys." The exploration team felt disconnected: "Operations people don't understand emerging tech or think strategically."

New ideas disconnected from real needs. The team built impressive demos, but departments didn't ask for them and couldn't use them. A blockchain proof-of-concept for records management was technically clever but solved no actual problem the Clerk's office had. They were experimenting in a vacuum.

Knowledge didn't transfer. When the team piloted successful solutions, operations staff had to maintain them without understanding the technology. Or

worse, pilots never moved to production because operations couldn't or wouldn't support them.

Risk aversion calcified in operations. With experimentation cordoned off to a special team, operations staff became even more conservative. "That's not our job. Send it to the other team." The culture reinforced that creative problem-solving was someone else's responsibility.

Governance struggled. How do you prioritize exploratory work versus operational work? Should pilot projects go through the same governance as everything else? The new team wanted autonomy; people wanted accountability.

After three years and significant investment, the CIO had to confront reality: the dedicated team had produced little organizational value. Impressive demos, yes. Actual deployed solutions improving services? Minimal. Meanwhile, the broader IT team's capability to think creatively had atrophied, not grown.

The organization disbanded the team. The structure was flawed from the start.

The real breakthrough came when they shifted approach entirely:

Creative problem-solving became everyone's responsibility. Every IT employee was expected to experiment within their area of responsibility, not just permission to try new approaches, but expectation. The network administrator explored better network management. The applications specialist piloted new business solutions. The service desk tested smarter support delivery.

IT and departments partnered on new ideas. Instead of IT experimenting in isolation, they partnered with departments to understand real problems, then collaborated on creative solutions. When the Planning department needed better community engagement tools, IT worked WITH them to pilot new digital engagement platforms, not building something in a lab and presenting it.

Small improvements became routine. Most creative work wasn't big breakthrough projects. It was continuous experimentation within daily work trying new approaches, testing emerging tools, improving processes creatively. The 20% improvement time included exploratory work.

Large initiatives got formal support. When significant opportunities emerged, initiatives requiring significant resources, organizational change, or real risk, they went through governance as strategic initiatives with dedicated resources.

Failure became learning. Not every experiment worked. That was fine. The question shifted from "Did this succeed?" to "What did we learn?" Intelligent failures (well-designed experiments that didn't work) were celebrated for the learning they generated.

Business Relationship Management enabled partnership. The trust and relationships built through BRM practices made collaborative experimentation possible. Departments trusted IT to partner on new ideas because IT had proven they understood departmental needs and delivered value.

The transformation wasn't instantaneous. It took two years of cultural change, skill development, and demonstrating that this distributed approach produced better results than the centralized team ever had.

But the outcomes were remarkable:

Departments now approached IT with fresh ideas on their own, knowing IT would partner effectively. The GIS team worked with Planning on community mapping tools nobody had asked for. The service desk tried AI-assisted ticket classification and cut response times. Infrastructure experimented with edge computing at remote facilities.

Creative thinking wasn't relegated to a special team doing "experimentation theater." It was embedded in how the organization worked. Every employee had permission, expectation, and support to experiment. And critically, new solutions emerged in partnership with the people IT served, so they addressed real needs and gained adoption.

That's what effective creative management looks like in local government IT. It's not a separate function, it's how you work. Everyone does it, not just a special team. And IT creates solutions with departments, not at them.

The Innovation Imperative for Local Government IT

For local government IT, creative problem-solving is existential.

Your residents just filed their taxes on their phone in three minutes. Then they came to your agency website and spent 20 minutes trying to pay a utility bill. That gap is real, and it's yours to close with a fraction of the budget Amazon or the IRS has.

Technology changes faster than government procurement cycles. Cybersecurity threats evolve constantly. Workforce expectations shift. Budget constraints tighten. The technology and approaches that worked five years ago are inadequate today and will be obsolete tomorrow.

Organizations that don't adapt don't stand still, they fall behind. Systems age, processes calcify, your best people disengage, and stakeholders lose confidence.

But pushing new ideas in local government IT faces unique challenges:

Resource constraints. With federal relief funds set to run out and government revenues continuing to dwindle, IT directors face fierce competition for tax dollars, forcing many departments to allocate limited budgets to routine maintenance tasks while strategic IT investments take a backseat.

Risk aversion. Public sector culture often penalizes failure more than it rewards success. You end up with conservative environments where "we've always done it this way" becomes the default response to new ideas.

Complexity. Government operations are complex, multiple departments, diverse needs, legacy systems, regulatory requirements, political dynamics. New approaches must work within this complexity.

Accountability pressures. Everything IT does is subject to public scrutiny, audit requirements, and political oversight. Experimentation inherently involves uncertainty and risk, which can conflict with accountability demands.

Talent limitations. Small IT teams can't have dedicated exploration staff. Everyone wears multiple hats. Finding time and capacity for creative work alongside operational demands is a perpetual challenge.

These aren't excuses. They're realities that your approach must address.

IT's Dual Role

Local government IT must push boundaries in two dimensions simultaneously:

1. Advancing Inside IT

IT must continuously improve its own operations, technologies, services, and capabilities:

- **Technology advancement:** Adopting emerging technologies (cloud, AI, automation) that improve IT capability and efficiency
- **Process improvement:** Finding better ways to deliver services, manage projects, handle support, deploy systems
- **Service creation:** Developing new services or dramatically improving existing services to deliver more value
- **Organizational development:** Building new capabilities, structures, and practices that make IT more effective

This internal work makes sure IT doesn't become the bottleneck preventing organizational progress. IT must modernize continuously to serve evolving organizational needs.

2. Enabling New Capabilities Across the Organization

IT must partner with departments to enable their growth:

- **Technology enablement:** Providing technology capabilities that make departmental breakthroughs possible
- **Strategic partnership:** Collaborating with departments to identify creative solutions to their challenges
- **Facilitation:** Helping departments understand technology possibilities and apply them creatively
- **Implementation support:** Building and deploying new solutions developed in partnership with departments

IT governance encourages growth and experimentation by creating a structured framework for IT decision-making, supporting the exploration of new technologies and ideas by providing clear guidelines and risk management processes.

This external enablement moves IT from serving the organization to helping it transform and improve through technology.

Both roles matter equally. IT that only advances internally becomes impressive but disconnected from what the organization actually needs. And IT that only enables departmental growth without modernizing its own operations eventually loses the capability to be an effective partner.

The 50/50 balance is essential.

Experimentation vs. Continuous Improvement: Distinction and Overlap

Before proceeding, we need clarity about how experimentation relates to continuous improvement (Sections 5.1–5.4).

Effective experimentation in local government IT requires an entrepreneurial mindset at all levels. Unlike large private sector organizations with dedicated R&D budgets and specialized teams, local government IT departments must work entrepreneurially finding creative solutions within tight constraints, taking calculated risks with limited resources, and turning problems into opportunities through resourcefulness rather than capital.

This entrepreneurial approach means:

- **Resourcefulness over resources:** Finding ways to move forward despite budget constraints, not waiting for perfect funding
- **Smart risk-taking:** Experimenting with new approaches in controlled ways, accepting that not every effort will succeed
- **Creative problem-solving:** Viewing limitations as design challenges rather than insurmountable barriers
- **Partnership thinking:** Collaborating with vendors, other agencies, and community partners to access capabilities you can't build alone
- **Opportunistic action:** Recognizing and seizing opportunities when they appear, even if they weren't in the plan

The most successful breakthroughs in local government don't come from massive transformation projects. They come from entrepreneurial IT professionals who see possibilities others miss, who experiment despite uncertainty, and who deliver creative solutions within real-world constraints. This entrepreneurial mindset seeing yourself as an owner and problem-solver rather than just a service provider is what enables small IT teams to push boundaries effectively.

They're distinct but overlapping concepts:

Continuous Improvement focuses on making existing processes, services, and systems better:

- Incremental enhancements to what already exists
- Optimizing current approaches to be more efficient, effective, reliable
- Reducing waste, eliminating bottlenecks, simplifying workflows
- Usually lower risk because building on proven foundation

Innovation focuses on introducing something fundamentally new or applying existing things in novel ways:

- Breakthrough changes that create new value or solve problems differently
- Adopting emerging technologies or approaches
- Reimagining how work gets done rather than optimizing current approach
- Usually higher uncertainty because venturing into less-proven territory

The overlap:

- Both require experimentation and learning
- Both involve changing current state
- Both need psychological safety and authority
- Both use similar intake, evaluation, and tracking processes
- Both are real work deserving time and resources
- Both require authority matching accountability

Practical distinction:

Ask: "Are we making what we have better (improvement) or are we doing something fundamentally new (experimentation)?"

Examples:

- Improving service desk ticket routing process = **Continuous Improvement**
- Implementing AI chatbot to handle common service desk inquiries = **experimentation**
- Enhancing existing network monitoring tools = **Continuous Improvement**
- Deploying SD-WAN to fundamentally change network architecture = **experimentation**
- Simplifying current project intake process = **Continuous Improvement**
- Adopting agile methodology where waterfall was the only approach = **experimentation**

Both matter. Both deserve support. The distinction helps with risk management and resource allocation, breakthrough efforts typically need more experimentation time, potentially more resources, and more explicit governance oversight than incremental improvements.

But they use the same fundamental framework established in Sections 5.1–5.4: ideas get captured through intake process, evaluated against criteria, resourced appropriately, tracked through performance management, and learned from regardless of outcome.

Everyone Contributes, No Elite Team

The most important principle: **Creative problem-solving is everyone's responsibility, not a specialized function.**

The Problem with Separate Teams

Many organizations, including some in government, have created dedicated labs or units focused exclusively on new ideas. The logic seems sound: designate people specifically focused on exploration, give them space to experiment, protect them from operational demands.

But this approach consistently produces problematic outcomes:

Creates Class Systems

Separate labs operate apart from the rest of the organization, which can create silos and disconnects between exploratory efforts and the organization's core business functions, with some employees doing "the cool stuff" while others handle operations.

Operations staff feel like second-class citizens doing "boring work" while the special team gets exciting projects. The exploratory team feels disconnected from operational realities. Resentment builds. Collaboration suffers.

Disconnects Ideas from Real Needs

Separate teams often experiment in a vacuum. They explore technologies and build solutions without deep understanding of actual operational problems or business needs. Result: impressive demos that don't get used because they don't solve real problems.

Prevents Knowledge Transfer

When a specialized team creates something, the operations team must maintain it without having developed deep understanding through involvement in creation. Or new solutions never reach production because "that's lab stuff, not real operations."

Reinforces Risk Aversion in Broader Organization

When experimentation is someone else's job, everyone else becomes more conservative. "We just keep things running. That's not our responsibility." The culture calcifies rather than evolves.

Recent Industry Trend Away from Separate Labs

By the end of 2023, a significant share of large companies had set up their own innovation labs. Since 2024, companies have been moving away from stand-alone units and reintegrating their in-house incubators. Walmart shut down its technology and business unit Store No. 8. Ford closed their Silicon Valley lab.

Why? Because it's very difficult for any one single team to be the subject matter expert and the tech expert at the same time, and these efforts have evolved to be more integrated across departments.

Building a Universal Culture of Experimentation

The alternative and demonstrably more effective approach is **decentralized creativity** where every employee has responsibility, capability, and expectation to experiment within their area of responsibility.

This shift allows employees at all levels to contribute their ideas and creativity, building an organization-wide culture of exploration, representing a departure from the traditional top-down approach where new ideas were confined to a select group of decision-makers.

Distributed Creativity in Action:

Service Owners Advance Their Services

The person responsible for network services explores emerging network technologies and approaches. The GIS specialist investigates new spatial analysis tools and techniques. The applications administrator pilots new ways to improve application performance or user experience.

Experimentation is integral to service ownership. Owning a service means continuously improving AND exploring new possibilities for it.

Teams Rethink Their Processes

Every team has permission and expectation to rethink how they work. Service desk experiments with support delivery. Project teams try new project management approaches. Operations teams explore better maintenance and monitoring methods.

Creative thinking becomes part of how work gets done, not a separate activity.

Everyone Contributes Ideas

Good ideas can come from anyone. The newest technician might see an opportunity that leadership misses. Frontline staff dealing with customers daily often identify solutions that remote management wouldn't conceive.

Building this culture can start with one person. Cultures of experimentation allow considerable freedom in deciding how work should be organized and tasks carried out, valuing commitment, creative risk-taking, and communication. One person taking initiative and demonstrating that all ideas are needed and welcomed creates safe space for peers to come forward.

Infrastructure Enables, Doesn't Restrict

Companies are implementing management solutions that enable employees to work on their ideas without unnecessary red tape, with clear KPIs and reporting mechanisms so new initiatives align with the organization's strategic goals while balancing structure and encouraging creativity.

The intake and evaluation framework supports experimentation just as it supports continuous improvement. Same process, potentially different evaluation criteria for higher-risk efforts.

The Cultural Prerequisites for Universal Experimentation

Decentralized creativity only works with specific cultural conditions:

Psychological Safety

Experimentation thrives when leaders create psychological safety. Research on high-tech teams found that those with more collaboration, open information sharing, and fair give-and-take achieved much higher levels of creative output, as when people feel safe, they help one another and collaborate on real fixes.

Without psychological safety, people won't propose new ideas for fear they'll be criticized or punished if the idea doesn't work.

Permission to Experiment and Fail

Companies that encourage intrapreneurship, open communication, risk-taking, and collaboration have the upper hand in sparking creative breakthroughs, with leadership supporting cross-functional collaboration, promoting experimentation, and making it safe to fail.

Government culture often struggles with this. Public accountability creates pressure for everything to succeed. But trying new approaches requires experimentation, and experimentation means some things won't work.

The cultural shift: differentiate between **intelligent failures** (well-designed experiments that didn't work but generated learning) and **incompetent failures** (poor execution or neglect).

Intelligent failures deserve celebration for the learning. Incompetent failures need addressing. Making this distinction explicit enables a culture of experimentation in risk-averse environments.

Empowerment with Authority

The authority principle from throughout this framework: people need authority to experiment in their areas.

If service desk staff identifies a better approach to ticket handling but must get five levels of approval before trying it, the idea dies. If a network administrator sees an opportunity for better network management but has no authority to pilot new approaches, nothing happens.

Empowerment means: "Within these boundaries (budget, security, compliance), you have authority to try new approaches. You don't need permission for small-scale pilots."

Time and Resources

The 20% time principle includes exploratory work. People need protected time to explore, experiment, pilot, and learn.

For small efforts (trying new tool, testing different approach, piloting process change), the 20% time is sufficient. For larger initiatives requiring significant resources, formal project allocation provides dedicated capacity (covered later in this section under Resource Allocation for Experimentation).

Skills and Capability Development

Not everyone knows how to experiment effectively. Some have a mindset of "this is how we've always done it." Others want to try new things but lack skills in experimentation, prototyping, evaluation.

Investment in capability development matters:

- Training in design thinking, experimentation methods, prototyping
- Exposure to emerging technologies through conferences, online learning, vendor relationships
- Cross-functional collaboration to learn from others' approaches
- Mentoring and coaching from those who've successfully pioneered new solutions

A company's ability to push boundaries starts from within through everyday culture, as you might have the best tech and AI-first approach, but if your people feel discouraged from experimenting, those resources won't make an impact and the tools will go unused.

What Leadership Must Do Differently

Creating this universal culture requires specific leadership actions:

Model Experimentation Personally

Leaders must visibly try new approaches in their own work. When the CIO experiments with a new approach to leadership team meetings or pilots a new communication tool, it signals that creative thinking is valued at all levels.

Celebrate Attempts, Not Just Successes

Recognize people who try new approaches even when they don't work perfectly. Share stories of "intelligent failures" and what was learned. Other people see that and feel safe to experiment.

Provide Air Cover for Reasonable Risks

When someone's experiment generates criticism or scrutiny, leadership must provide protection: "We're trying new approaches to serve citizens better. This experiment didn't work as hoped, but we learned valuable lessons. That's how improvement happens."

Remove Obstacles Systematically

When people identify barriers preventing experimentation approval bottlenecks, resource constraints, policy restrictions, technical limitations leadership must actively work to remove them.

Make Expectations Clear

Experimentation isn't an optional extra when time allows. It's part of everyone's job. Performance discussions and goal-setting should explicitly address: "What new approaches are you exploring in your area of responsibility?"

Integrate New Thinking into Regular Operations

Don't treat exploration as separate from operations. Integration means: new ideas discussed in team meetings, pilot initiatives tracked alongside other work, experiment results reported in regular updates.

IT-Led Breakthroughs for the Organization

Half of IT's responsibility is enabling breakthroughs across departments and the broader organization. IT moves from service provider to strategic partner here for new solutions.

IT as Enabler: The Strategic Partnership

The relationship established through Business Relationship Management creates foundation for creative partnership.

How BRM Enables Breakthroughs:

BRM Identifies Opportunities

Through regular engagement with departments, IT learns about:

- Problems departments struggle with that might have innovative technology solutions
- Changes in department operations that create new technology needs
- Emerging opportunities in department missions that technology could enable
- Frustrations with current systems that new approaches might resolve

Example: Regular meetings with Planning department reveal they're struggling with community engagement. Traditional public meetings have low attendance and limited reach. This becomes an opportunity: "What if we piloted digital community engagement platform?"

BRM Builds Trust That Makes Breakthroughs Possible

This work requires trust. Departments must trust that IT:

- Understands their needs and mission
- Will partner effectively rather than dictating solutions
- Can deliver on new initiatives
- Will support them through change and learning

Trust doesn't come from special projects. It comes from sustained relationship through BRM. The departments that trust IT through successful service delivery are departments that will partner on new ideas.

BRM Enables Collaborative Problem-Solving

IT doesn't create solutions at departments. IT creates solutions with departments.

The days of corporate problem-solving being a solo effort are long gone, as collaborating with partners within the value chain and cross-functional partnerships enable organizations to address complex problems collectively.

BRM provides the relationship channel for this collaboration:

- Joint problem definition ("What are you trying to accomplish?")
- Collaborative solution exploration ("What approaches might work?")
- Partnership through pilot implementation ("Let's try this together and learn")
- Shared learning from results ("What did we learn? What should we do differently?")

BRM Communicates New Solutions and Drives Adoption

Even great solutions fail without adoption. BRM helps:

- Communicate what new capabilities are available and their value
- Address concerns and resistance to change
- Support departments through adoption and learning
- Gather feedback for refinement

Technology as a Driver of Organizational Breakthroughs

IT's role extends beyond delivering technology to helping the organization understand what technology makes possible and applying it creatively.

Discovery and Education

Most department staff don't follow technology trends. They focus on their mission. IT's responsibility is monitoring the technology environment and identifying relevant opportunities:

- "We're seeing emerging technologies in [area]. These might help with [your challenge]."
- "Other governments are experimenting with [technology]. Should we explore whether this applies to us?"
- "Based on your strategic priorities, these technology trends seem relevant…"

This educational role, helping departments understand possibilities, is a prerequisite for collaborative problem-solving.

Translating Department Needs into Technology Solutions

Departments describe problems in operational terms: "We need better way to track maintenance requests." "Community members can't find information on our website." "Our permit process takes too long."

IT translates these into technology opportunities:

- Maintenance tracking → mobile work order management with real-time updates

- Website findability → AI-powered search and chatbot
- Permit delays → digital permit platform with automated workflows

This translation capability, understanding both domain problems and technology possibilities, is IT's unique value as a strategic partner.

Piloting and Proving Value

IT leads the technical implementation of new solutions developed collaboratively with departments:

- Designing pilot approaches that limit risk while testing value
- Building or configuring new solutions
- Supporting departments through pilot learning period
- Evaluating results objectively to determine whether to scale

The pilot methodology is critical in risk-averse government environment. Pilots allow experimentation with limited commitment. Successful pilots build confidence for broader adoption.

IT-enabled departmental breakthroughs follow recognizable patterns: digitizing paper processes, putting data in front of decision-makers, delivering services online, and automating routine work. The common thread is IT partnering with departments to apply technology to their real challenges, not building solutions departments didn't ask for.

Making Departmental Breakthroughs Sustainable

IT-enabled efforts fail if:

- IT builds the new solution then walks away, leaving department unable to use/maintain it
- Solution never gets adopted because IT didn't partner on change management
- Pilot succeeds but never scales because resources weren't allocated for production deployment
- A new solution solves one department's problem but creates unsustainable support burden for IT

Lasting results require:

Co-ownership from Start

Department must own their part of the effort from beginning. IT provides technology expertise and implementation, but department owns:

- Problem definition and success criteria
- User involvement and feedback
- Change management and adoption within department
- Long-term business process ownership

Support Model Established Before Scaling

Before successful pilot becomes production service, establish:

- Who provides ongoing support (IT? Department? Hybrid?)
- What training is needed for department users and IT support staff
- How solution will be maintained and updated
- What costs are involved and how they're funded

Integration with Existing Services

New solutions must integrate with IT's service portfolio. Don't create one-off solutions that can't be supported long-term.

Knowledge Transfer and Documentation

IT must transfer knowledge to department users and document solutions for long-term supportability. New solutions shouldn't create dependency where only original developers understand solution.

Advancing IT From Within

While IT enables departmental breakthroughs, IT must simultaneously advance its own operations, technologies, services, and capabilities.

Why Internal IT Advancement Matters

IT that doesn't advance internally eventually lacks capability to partner effectively with departments on new solutions. Technology moves too fast, demands evolve too quickly, and approaches become obsolete.

Internal IT advancement serves several purposes:

Maintains Capability and Relevance

CIOs now list creative thinking as the most important trait they need to bring to their role, according to a 2024 survey by professional services firm Deloitte, ahead of delivering top-line value and serving as change agents.

When technology, tools, and practices stagnate, everything downstream suffers: systems become barriers, processes drag, and your team can't deliver what the organization needs.

Improves Efficiency and Effectiveness

Advancing your own operations creates capacity. Automation cuts manual effort, better tools boost productivity, and improved processes accelerate delivery.

This efficiency gain is critical for small government IT teams with limited resources.

Builds Creative Muscle

IT that regularly pushes its own boundaries develops organizational capability in experimentation, learning, and change. This capability then transfers to helping departments push their own boundaries.

IT can't credibly guide departments through change if IT hasn't experienced it themselves.

Demonstrates Commitment to Improvement

When IT visibly improves its own operations through creative solutions, people see IT is committed to progress. This builds credibility for IT's role as a capable partner.

Four Domains of Internal IT Advancement

Internal IT advancement plays out across four domains. Technology advancement is about adopting cloud, AI, modern development practices, and emerging technologies that actually serve your mission. Process advancement pushes you to find fundamentally better ways to deliver services, manage projects, handle changes, and share knowledge. On the service side, you're creating new service categories, reimagining how existing services work, and raising quality. And organizational advancement covers the people dimension, developing new skills, rethinking team structures, improving collaboration, evolving performance management.

Balancing Internal and External Efforts

IT faces constant tension: invest in internal advancement or prioritize external efforts enabling departments?

Both matter. Neither can be neglected. The balance:

Internal advancement creates capacity for external breakthroughs.

Process improvements, automation, and technology modernization create efficiency that frees capacity for departmental partnership.

External breakthroughs justify internal advancement. When IT delivers breakthrough solutions for departments, people see IT value, which builds support for investing in internal IT improvements.

Different timescales help balance. Many internal advances are small-scale improvements that happen within regular workflow. Larger departmental breakthroughs are often formal initiatives with dedicated resources. They're not competing for same capacity.

Portfolio approach manages balance. Through governance, explicitly allocate experimentation capacity: X% for internal IT work, Y% for departmental enablement. Make tradeoffs transparent and strategic.

For typical small government IT organization (15–20 staff), reasonable balance might be:

- 60% of creative effort on internal IT improvements (because they create efficiency and capability)
- 40% on departmental breakthrough partnership (because they deliver visible organizational value)

Adjust based on circumstances. Organizations with severely outdated IT infrastructure might need 70/30 toward internal advancement temporarily. Organizations with strong IT foundation and eager departmental partners might shift toward 40/60.

The Framework for New Ideas

Experimentation needs structure without bureaucracy. System that enables rather than constrains.

The framework established in Sections 5.1–5.4 for continuous improvement applies equally to experimentation, with some additional considerations for higher-risk, higher-uncertainty new initiatives.

Idea Intake: Capturing Ideas

New ideas can originate anywhere:

- Employees identifying new opportunities in their work
- Leadership seeing strategic experimentation needs
- Departments requesting creative solutions to problems
- Technology vendors presenting new products
- Peer organizations sharing new approaches
- Technology trends creating new possibilities

The intake process captures new ideas using same mechanisms:

- Structured feedback and suggestion systems
- Regular experimentation discussions in team meetings
- Formal submission process through performance management system
- Strategic planning process identifying major new initiatives
- Governance discussions surfacing cross-organizational experimentation needs

Tag as Experimentation vs. Improvement

Use same intake process but categorize: Is this incremental improvement (making existing thing better) or experimentation (doing something fundamentally new)?

The distinction matters for:

- Evaluation criteria (new initiatives may have higher uncertainty)
- Resource allocation (new initiatives may need more experimentation time)
- Risk assessment (new initiatives typically carry more risk)
- Governance level (major new initiatives may need higher-level approval)

Idea Evaluation: Deciding What to Pursue

Not every experimentation idea deserves pursuit. Evaluation criteria help determine what to invest in.

Standard Evaluation Criteria:

- Strategic alignment: Does this advance organizational priorities?
- Impact potential: How much value could this create?
- Effort required: What's the resource investment?
- Organizational readiness: Are we prepared for this?
- Risk assessment: What could go wrong?

Additional Experimentation-Specific Criteria:

Novelty and Differentiation

Is this truly innovative or just catching up to standard practice? Both matter, but experimentation often prioritizes things that create differentiation or breakthrough value.

Learning Value

Even if uncertain whether experimentation will succeed, what would we learn from attempting it? High learning value can justify attempting new initiatives with uncertain outcomes.

Scaling and Sustainability

If this new pilot succeeds, can we scale it? Can we sustain it long-term? New initiatives that can't scale or sustain may still have value as learning experiments, but that should be explicit expectation.

Market Maturity

Is this emerging technology mature enough for government adoption? Sometimes being early adopter creates advantage. Sometimes it creates expensive problems. Assess maturity honestly.

Vendor Management

Is there a healthy vendor market supporting this technology? new initiatives dependent on single vendor or nascent market carry higher risk.

Evaluation Approaches for Different Initiative Sizes:

Small Initiatives (Autonomous Level):

- Individual or team can proceed with supervisor awareness
- Limited resources required (within 20% improvement time)
- Limited risk (easy to reverse if doesn't work)
- Evaluation: Does this make sense given your service ownership responsibilities? Proceed.

Mid-Scale Initiatives (Management Approval):

- Requires some dedicated resources beyond routine time

- Moderate risk or cross-team impacts
- Evaluation: Manager reviews against criteria, approves or redirects

Large Initiatives (Governance Level):

- Significant resource requirements or organizational change
- High risk or major strategic implications
- Evaluation: Full governance review using decision paper format

Resource Allocation for Experimentation

Experimentation requires time and resources. How to allocate:

Combination Approach (per your direction):

Small Initiatives: Happen within the 20% improvement time. Experimentation IS improvement work. People use protected improvement time for new experiments, pilots, and learning.

Large Initiatives: Become formal initiatives with dedicated project resources. Strategic new initiatives identified through governance get explicit resource allocation, dedicated staff time, budget for tools/licenses, external expertise if needed.

Budget Allocation:

Reserve portion of IT budget specifically for experimentation:

- Small experimentation budget for tools, trials, learning (might be $10–20K annually for a small IT team)
- Strategic experimentation budget for major initiatives (allocated through annual planning and governance)

Having dedicated experimentation budget prevents "we can't afford to try that" from killing good ideas. Even modest allocation signals experimentation is valued.

Implementation Approach: Pilot Methodology

Experimentation implementation should generally follow pilot methodology rather than big-bang deployment:

Phase 1: Small-Scale Pilot

- Limited scope, limited users, limited duration
- Focus on learning: Does this work? Do users value it? What problems emerge?
- Rapid iteration: Adjust based on early learning
- Clear success criteria: What would make us proceed vs. stop?

Phase 2: Expanded Pilot

- Broader scope if Phase 1 successful
- More users, longer duration, more realistic conditions

- Focus on scaling: Can this work at larger scale? What's required for long-term viability?
- Refined success criteria based on Phase 1 learning

Phase 3: Production Deployment (or Termination)

- If pilots demonstrate value: scale to production with appropriate support model
- If pilots show experimentation doesn't work: terminate with documentation of learning
- If pilots show promise but require refinement: iterate and extend piloting

No "pilot purgatory": Pilots must have defined endpoints and decision points. Don't let pilots run indefinitely without decision about production deployment or termination.

Integration with Governance

Experimentation governance follows multi-level model (per your direction):

Level 1: Autonomous Small new initiatives

Service owners, teams, and individuals have authority to pursue small new initiatives within their areas:

- No formal governance approval needed
- Stays within allocated improvement time and budget
- Limited risk and reversibility
- Report through regular performance management and 1:1s

Level 2: Management-Approved new initiatives

New initiatives requiring moderate resources or having broader impact:

- Manager reviews using evaluation criteria
- Ensures coordination with team goals and organizational priorities
- May need coordination with other teams
- Tracks through department-level goal management

Level 3: Governance-Approved Strategic new initiatives

Major new initiatives with significant resource requirements, organizational change, or strategic implications:

- Full governance review
- Decision paper format presenting opportunity, options, recommendation
- Executive or board approval if significant budget or policy implications
- Formal project structure with dedicated resources
- Regular governance review of progress and outcomes

Experimentation Portfolio Management

Governance maintains portfolio view of all significant experimentation initiatives:

- What new initiatives are in pilot phase?
- What resources are committed to experimentation versus other priorities?
- What's the balance between internal and external experimentation?
- What's the risk profile of portfolio of experiments?

This portfolio perspective enables strategic management of experimentation investment.

Integration with Continuous Improvement Framework

Experimentation uses the same infrastructure as continuous improvement (Sections 5.1–5.4):

Same Intake Process

New ideas flow through same improvement suggestion and feedback mechanisms. Just tagged/categorized differently.

Same Performance Management System

Experimentation initiatives tracked in same system as improvement goals. Provides visibility to creative work alongside all other work.

Same 1:1 Discussion Framework

Creative work discussed in regular 1:1 meetings just like improvement work. Progress, obstacles, learning, all part of regular performance conversations.

Same Recognition and Celebration

Creative achievements celebrated through same recognition systems established for continuous improvement.

Same Learning Orientation

Experiment outcomes, successful or unsuccessful, generate learning captured and shared just like improvement outcomes.

The integration is intentional: experimentation isn't separate organizational capability. It's part of continuous improvement and a learning orientation.

Making This Sustainable

Experimentation initiatives fail when:

- Initial enthusiasm fades and experimentation gets deprioritized for operational demands
- Leadership changes and new leader doesn't value experimentation
- Successful pilots never scale because no resources allocated for production
- Failed experiments generate criticism that kills future experimentation

- Experimentation becomes performative ("performance theater") without real organizational impact

Long-term viability requires specific practices:

Balancing Experimentation with Operations

Operational delivery can't stop while pursuing experimentation. Finding sustainable balance:

Explicit Capacity Allocation

Through governance and resource planning, explicitly allocate capacity:

- What percentage of organizational capacity for experimentation? (Typically 10–20% for healthy culture of experimentation)
- What percentage for operational delivery? (60–70%)
- What percentage for continuous improvement? (10–20%, with experimentation being subset)

Make allocation visible. Prevents experimentation from being "extra" work that never gets done.

Operational Stability Enables Experimentation

Organizations with unstable operations can't sustainably innovate. Constant firefighting consumes all capacity.

Invest in operational stability first:

- Reliable infrastructure with monitoring and ahead-of-failure maintenance
- Well-managed services with clear ownership
- Effective support processes minimizing reactive work
- Technical debt management preventing accumulation

Stable operations create capacity for experimentation. Conversely, experimentation in operations can create stability (automation, improved processes).

Experimentation as Operations Enabler

Frame experimentation as investment that will improve operational efficiency and capability. This work enables better operations. It doesn't compete with them.

Process automation, infrastructure modernization, improved tools, these new initiatives reduce operational burden long-term.

Measuring Experimentation Effectiveness

Traditional ROI measurement struggles with experimentation because:

- Value often difficult to quantify upfront
- Benefits may take time to materialize
- Learning value from "failed" new initiatives doesn't show in financial metrics
- Creative success rates typically lower than improvement initiatives

Balanced Experimentation Metrics (per your direction):

Traditional ROI Metrics (but don't over-emphasize)

- Cost savings from new initiatives
- Efficiency gains (time saved, capacity created)
- Revenue or service volume impact

Experiment Accounting Metrics

- Number of experiments/pilots run
- Speed of experimentation (time from idea to pilot)
- Learning generated (documented insights from experiments)
- Ideas converted to pilots (idea pipeline health)
- Pivot rate (new initiatives adjusted based on learning)

Adoption and Impact Metrics

- Percentage of successful pilots moved to production
- Number of users/departments benefiting from new initiatives
- Stakeholder satisfaction with creative partnerships
- Degree of transformation achieved (incremental vs. breakthrough)

Learning from Failure

Experimentation requires giving people freedom to think their crazy thoughts out loud, and if you want your team to come up with brilliant ideas, you have to create a culture where people feel safe, happy, and heard.

Types of Failure in Experimentation:

Intelligent Failures (celebrate and learn)

- Well-designed experiment that didn't produce expected results
- New approach tried thoughtfully that proved ineffective
- Technology pilot that revealed limitations not apparent initially
- Experimentation that worked technically but lacked organizational adoption

These failures deserve recognition for good thinking and learning generated. Share lessons widely. Celebrate courage to experiment.

Avoidable Failures (learn and improve)

- Poor planning or execution
- Inadequate stakeholder engagement
- Ignoring known risks
- Insufficient pilot before scaling

These failures need honest assessment: What should we do differently next time? The learning is about process improvement, not the experimentation itself.

Process for Learning from Experimentation Failures:

1. **Conduct failure retrospective:** What happened? What was learned? What would we do differently?

2. **Document and share learning:** Don't let learning die with the team. Share across organization.

3. **Extract transferable insights:** What from this failure applies to other new initiatives?

4. **Update experimentation practices:** How do our evaluation criteria, pilot methodology, or governance need to evolve?

5. **Celebrate the learning:** Publicly recognize team for good thinking and learning generation, even though outcome wasn't what hoped.

Scaling Successful New Initiatives

Successful pilots must transition to sustained production. This requires:

Production Readiness Assessment

Before scaling:

- Is solution stable and reliable enough for production?
- Do we have support model defined and staffed?
- Is documentation complete for users and support staff?
- Are dependencies and integration points addressed?
- Is there budget for ongoing costs (licensing, maintenance)?

Change Management and Adoption

Scaling requires organizational change management:

- Communication about what's changing and why
- Training for users and support staff
- Phased rollout allowing adaptation and learning
- Support during transition period
- Feedback mechanisms to refine based on broader use

Integration with Service Portfolio

Successful experimentation becomes regular service:

- Add to service catalog
- Assign service owner
- Establish service levels and support processes
- Include in portfolio management and planning

Capturing and Sharing Success

Document and communicate successful experiments:

- Case studies showing problem, solution, outcome
- Metrics demonstrating value delivered
- Lessons learned during experimentation and scaling

- Recognition for teams that led experimentation

Success stories build organizational confidence in experimentation and inspire future new initiatives.

Building a Continuous Culture of Experimentation

Sustainable experimentation requires continuous investment in experimentation culture:

Regular team showcase

Quarterly or semi-annual events where teams present:

- New initiatives they're piloting
- Results from completed new initiatives
- Lessons from experiments that didn't work
- Ideas they're considering

This visibility creates shared learning and inspires others to innovate.

Experimentation time Protection

Don't allow operational pressures to consistently eliminate experimentation time. When cutting scope due to capacity constraints, protect some creative capacity.

Message: "We're deferring this operational work, but we're protecting creative capacity because our long-term effectiveness depends on continuous improvement and experimentation."

Leadership Attention and Reinforcement

Creativity dies without consistent leadership attention:

- Include new thinking in regular governance meetings
- Discuss experimentation in performance reviews
- Celebrate experimentation in organizational communications
- Resource experimentation appropriately in budgets
- Model experimentation in leadership's own work

Connecting Experimentation to Values

Experimentation should explicitly connect to organizational values:

- Service value: experimentation improves how we serve community
- Excellence value: experimentation helps us deliver higher quality
- Stewardship value: experimentation helps us use resources responsibly
- Learning value: experimentation builds our capability and knowledge

When experimentation aligns with values, it's culturally reinforced rather than being a separate initiative.

How This Connects to the Broader Framework

Innovation doesn't happen in a vacuum. It depends on the safety, structure, capability, and strategic clarity you've built across every previous module:

The leadership capabilities from Module 1 are essential for building an experimentation culture:

- Time management (Section 1.2) is how you carve out space for experimentation when operational demands compete for every hour
- Self-awareness (Section 1.3) matters here. Leaders often kill experimentation without realizing it
- Political navigation (Section 1.4) lets you build support for initiatives that face resistance
- Communication (Section 1.5) lets you celebrate efforts publicly and explain why experimentation matters

Experimentation thrives in a healthy organizational culture from Module 2:

- Vision (Section 2.2) connects experimentation to mission. It advances where you're headed
- Capabilities (Section 2.4) frames experimentation as development, not distraction
- Culture (Section 2.5) determines whether experimentation feels safe or career-threatening

Strategic direction and governance from Module 3 keep experimentation focused:

- Governance (Section 3.1) and strategic planning (Section 3.2) evaluate which experiments deserve resources
- Frameworks (Section 3.3) prevent new initiatives from becoming unsustainable one-offs by integrating them with existing architecture
- Services alignment (Section 3.4) makes sure experiments address real business problems

Service delivery from Module 4 both drives experimentation needs and benefits from what it produces:

- Portfolio management (Section 4.2) gives new services a home in your existing structure
- Customer service (Section 4.4) insights surface where innovation is needed most
- Business relationships (Section 4.5) create the partnership foundation for experimenting collaboratively with departments

Earlier in Module 5:

- Feedback and Engagement (Section 5.1) established the cultural foundation with 20% improvement time that includes creative work and psychological safety enabling experimentation
- Making Things Better (Section 5.3) created the improvement framework that innovation uses: intake mechanisms, evaluation criteria, obstacle removal, empowerment with authority
- Performance Management (Section 5.4) tracks innovation initiatives alongside other goals and celebrates innovation achievements

Innovation serves organizational mission and values, never its own sake. The vision established in Section 2.2 provides direction for innovation, and values provide evaluation criteria: Does this innovation align with who we aspire to be?

Key Takeaways

Innovation must be everyone's responsibility, not delegated to a separate innovation team that creates class divisions and disconnects innovation from operational reality.

IT has a dual innovation role: innovating internally (technology, processes, services, organization) and enabling departmental innovation through strategic partnership (Section 4.5).

Innovation and continuous improvement are distinct but overlapping, breakthrough versus incremental, and use the same intake, evaluation, and tracking framework, with adjustments for higher risk and uncertainty.

Multi-level governance scales decision rights to scope: small innovations stay autonomous, medium innovations need management approval, large innovations require formal project structure.

Psychological safety and permission to fail are prerequisites for an innovation culture. Differentiate intelligent failures (learn and celebrate) from incompetent failures (address and improve).

Sustainable innovation requires explicit capacity allocation, operational stability as a foundation, protected innovation time, and continuous leadership attention and reinforcement.

Successful innovations must transition to sustained production with proper support models, change management, and integration into the service portfolio.

Reflection Questions

Before proceeding, assess your innovation leadership capability:

1. Does your IT organization have any form of separate "innovation team" or lab? If so, what problems has it created or solved? If not, how is innovation currently happening (or not happening)?
2. When was the last time someone in your IT organization proposed an innovative idea? What happened to it? Did it get pursued, or did it die? Why?

3. Do your employees believe they have permission and expectation to innovate in their areas of responsibility, or do they believe innovation is leadership's job?
4. When you think about innovations your IT organization has attempted in past three years, what percentage succeeded, failed intelligently (learned from), or failed due to poor execution?
5. How do you currently balance internal IT innovation (improving your own operations) with external innovation (enabling departmental innovation)? Is that balance intentional or accidental?
6. What departmental innovation opportunities exist right now where IT could be a strategic partner? What's preventing those partnerships from forming?
7. When innovative experiments don't work as hoped, what happens? Are failures punished, ignored, or celebrated for learning? What message does your response send about risk-taking?
8. Do you have explicit resource allocation for innovation (time, budget, capacity), or is innovation expected to happen "when we have time" (which means it rarely happens)?
9. How do you currently measure innovation effectiveness? Do your metrics encourage the right behaviors and outcomes?
10. If you asked your stakeholder departments "Is IT an innovation partner or an obstacle to innovation?", what would they say? Why?

The working documents for this section are in Appendix A.5.5.

Module 5: Summary

Continuous Improvement: Building Organizations That Never Stop Getting Better

I've watched this happen more times than I can count: an IT organization does the hard work of building leadership capability, getting the right people in place, standing up governance, and delivering solid service. And then they stop. They treat "getting good" as a destination rather than a direction. Within three to five years, that organization is struggling again, because everything around them kept moving while they stood still.

The organizations that sustain high performance over decades share one trait: they never stop improving. Not through heroic periodic transformation efforts, but through steady, deliberate, built-into-the-DNA improvement that happens every week. Module 5 is about building that capability into your organization so improvement becomes how you operate, not something you do on top of operations.

The five sections of this module build on each other:

Section 5.1: Feedback and Engagement laid the cultural groundwork. Continuous improvement only works when feedback flows freely in all directions, when people feel safe proposing changes, and when improvement work is treated as real work, not something you do after the "real work" is done. The 20% principle of protecting dedicated improvement time isn't aspirational. It's the minimum investment that keeps an organization from slowly calcifying.

Section 5.2: Organizational Integration addressed how to embed IT governance into the broader organization's decision-making processes. Integration isn't about IT controlling technology decisions. It's about making technology governance a natural part of how the organization already operates, adding checkpoints to existing workflows rather than creating separate processes people bypass. When IT governance is woven into budget cycles, board agendas, and procurement processes, compliance becomes automatic rather than something you have to enforce.

Section 5.3: Making Things Better moved from culture to action. Your role as CIO isn't to personally improve everything. It's to build an environment where improvement happens: clear authority, simple intake processes, obstacle removal, and entrepreneurial ownership at every level. When people have both the permission and the capacity to make things better, they do.

Section 5.4: Performance Management for Continuous Improvement built accountability into the system. If improvement work isn't tracked, measured, and celebrated, it gets crowded out by operational urgency every time. Reframing performance management from annual evaluation to continuous development, using OKRs that connect individual goals to organizational maturity, and making 1:1

meetings real feedback loops rather than status updates are how you make sure improvement happens.

Section 5.5: Innovation Leadership extended the framework to breakthrough change. Innovation isn't a separate activity for a special team. It's a specialized form of continuous improvement where you apply creative thinking to create step-change results. IT has a dual innovation role: improving internal operations and enabling innovation across the departments you serve.

How These Sections Work as a System

These five sections aren't independent practices. They're an integrated system where each piece depends on the others:

Culture (5.1) creates the environment where people feel safe experimenting and proposing changes. Without psychological safety, improvement efforts become performative compliance.

Organizational integration (5.2) weaves improvement governance into budget cycles, board agendas, and procurement workflows so IT oversight becomes a natural part of how the organization operates.

Leadership framework (5.3) translates that cultural groundwork into practical mechanisms: intake processes, evaluation criteria, decision rights, obstacle removal.

Accountability (5.4) keeps improvement work consistent rather than sporadic**.** What gets tracked and celebrated gets repeated.

Innovation (5.5) extends the system to handle breakthrough changes alongside incremental improvements.

Culture + Leadership + Accountability + Innovation = Lasting Improvement Capability.

The underlying principle is straightforward: organizations that continuously improve don't just maintain what they've built. They keep building. They adapt as conditions change. They evolve while remaining true to purpose. They never stop getting better.

How Module 5 Connects to Everything Before It

Continuous improvement doesn't stand alone. It depends on and reinforces everything you've built in Modules 1 through 4.

Module 1 (Being a Government IT Leader) gave you the personal competencies improvement requires: time, self-awareness, political skill, and clear communication.

Module 2 (Building a Healthy Organization) established the organizational conditions improvement requires: a clear vision, the right structure, capable people, and a healthy culture.

Module 3 (Working on the Right Stuff) provided strategic direction: governance prioritizes initiatives, strategic planning sets targets, frameworks anchor practice, and budgets allocate resources.

Module 4 (Delivering Great Service) is both the driver and the beneficiary of continuous improvement: portfolio structure, knowledge capture, service friction reduction, and partnership relationships.

The whole framework reinforces itself. Sustainable continuous improvement depends on what you've built in Modules 1 through 4. And without improvement embedded in operations, even the best organizational design stagnates over time.

Final Thoughts

You have now completed Module 5: Continuously Improving.

This module provided the framework for building sustainable continuous improvement capability, creating organizations that never stop getting better. You have the tools to create cultures where feedback flows freely, improvement work is valued and resourced, performance management drives development, and innovation happens systematically.

With all five modules complete, you have the HPG-IT Framework:

- Module 1: Being a Government IT Leader
- Module 2: Building a Healthy Organization
- Module 3: Working on the Right Stuff
- Module 4: Delivering Great Service
- Module 5: Continuously Improving

You now possess a complete framework for building high-performing government IT organizations. The work ahead is implementation, applying these frameworks systematically, persistently, with commitment to continuous learning and development.

The work never ends. Organizations committed to continuous development use change as fuel for growth. They build capability from challenges. They keep building on what they've achieved.

The HPG-IT Framework enables exactly this. Not reaching some perfect end state, but building organizational capability to keep learning, keep adapting, keep improving, and keep delivering value to the communities you serve.

The work continues. And it's worth it.

The working documents for this module are in Appendix A.5.M.

THE WORK BEGINS

A Framework Is Not a Destination

About two years into implementing the concepts that would become the HPG-IT Framework, I had what felt like a setback. We'd made significant progress on our governance structure, our strategic alignment was strong, and our team culture had never been better. Then our County Executive Officer asked me a simple question during a budget discussion: "How do you know your department is performing well?"

I gave him what I thought was a good answer, our ticket metrics, our response times, our customer satisfaction scores. All solid numbers. He listened, nodded, and then asked: "But how does that connect to what the Board cares about? How does it support what departments are trying to accomplish?"

I didn't have a good answer. And I realized in that moment that despite all our progress, I'd been thinking about performance in isolation rather than as part of the integrated system we'd built. The governance structure was there. The strategic alignment existed. But I hadn't fully connected the dots between our continuous improvement work and the strategic outcomes that mattered to the organization.

That conversation taught me something critical: implementing a framework means building an integrated system where everything connects and reinforces everything else. And it's never "done."

Understanding the Framework as a System

Think of the HPG-IT Framework as a house you're building for your IT organization:

The Foundation (Module 1: Being a Government IT Leader) is where everything starts. Without solid leadership principles, self-awareness, communication skills, and the ability to handle ambiguity, nothing else will stand. You can't build organizational health on a weak leadership foundation. This is why we start here.

The Frame and Structure (Module 2: Building a Healthy Organization) comes next. This is your leadership team, your organizational structure, your culture, and your people capabilities. The frame determines what your house can become. A poorly constructed frame limits everything you can build on top of it. Invest here, and you build the conditions for excellence.

The Systems (Module 3: Working on the Right Stuff) are like the electrical, plumbing, and HVAC that make the house functional. Governance, strategic planning, frameworks, service portfolio, and budget management, these are the systems that connect your IT organization to the larger entity you serve. Without these systems properly designed and integrated, you're just building rooms that don't work together.

The Living Spaces (Module 4: Delivering Great Service) are where the actual work happens. Your customers experience what you've built here. Service delivery, project management, relationship building, this is what people see and interact with daily. But notice: you can't create excellent living spaces without the foundation, frame, and systems in place first.

The Maintenance and Improvement (Module 5: Continuously Improving) is the ongoing care that keeps everything working and evolving. Feedback loops, systematic improvement, performance management, and innovation, these ensure your house doesn't deteriorate and gets better over time.

The critical point: you can't skip the foundation and frame to jump straight to improving your living spaces. You can't install systems before you have a solid structure to support them. And all the maintenance in the world won't fix fundamental problems with your foundation.

Everything rests on Modules 1 and 2. Your leadership capability and organizational health determine what's possible in Modules 3, 4, and 5. And this is why authority must match accountability, you can't be held accountable for service excellence if you don't have the authority to address the organizational health issues that prevent excellence.

The framework is integrated by design. Each module builds on and reinforces the others. Change one element, and it affects the entire system.

The Reality of Implementation

Now for the practical truth: you won't implement this framework perfectly. You can't. And you shouldn't try.

Your organization has gaps. Every organization does. You have constraints, budget, staff, political realities, legacy systems, cultural challenges, competing priorities. You have fires to put out today that can't wait for you to build the perfect foundation.

This is the reality of local government IT leadership. We work in environments where we're expected to keep the lights on while simultaneously transforming the organization. Where we're judged by both today's service delivery and tomorrow's strategic value. Where we serve elected officials, executive leadership, department heads, employees, and ultimately citizens, all with different expectations and priorities.

The HPG-IT Framework isn't about achieving perfection. It gives you a map so you know where you are, where you're going, and what gaps you need to address. It helps you make informed choices about what to prioritize and sequence. And it supports building systematically toward something better rather than bouncing from crisis to crisis or chasing the latest trend.

Some of you reading this are thinking: "I don't have time for all this. I have three critical positions vacant, a cybersecurity assessment due next month, and the finance director demanding to know why our ERP upgrade is behind schedule."

I get it. I've been there. But here's what I learned: when you don't have time to do the core work, you create more crises that consume even more time. When you don't address organizational health issues, you burn out good people and can't retain replacements. When you don't have strategic alignment, you waste resources on initiatives that don't matter. When you don't build service excellence systematically, you're constantly firefighting instead of delivering value. When you don't invest in continuous improvement, you're solving the same problems repeatedly.

This approach doesn't add work. It helps you do the right work in the right order. It helps you stop spinning your wheels and start gaining traction.

Your Implementation Path

If you're feeling overwhelmed looking at five modules with multiple sections each, that's normal. Let me make this practical.

Start with Module 1: Being a Government IT Leader

Begin by honestly assessing your own leadership capability. Use the Module 1 self-assessment in Appendix A.1.M. Where are your gaps? What do you need to develop?

Work through the five sections:

- Know your purpose and role as a leader (not a technical expert)
- Prioritize your time on leadership work (not just technical work)

- Inventory and develop your leadership competencies
- Handle ambiguity and politics effectively
- Communicate clearly and consistently

Don't rush this. Give yourself 90 days to really work on your leadership foundation. Use the action plans. Do the reflection questions. Be honest about what you need to change. Your organization's transformation begins with your own.

If you skip this module or give it superficial attention, everything else will be harder than it needs to be. Your leadership capability is the constraint that determines what's possible.

Then Assess Across All Modules

Once you've done genuine work on your leadership foundation, conduct a full assessment of your IT organization across all five modules. Use the self-assessments in Appendix A: The Field Guide.

This assessment will reveal your gaps. You'll find areas where you're strong and areas where you have significant work to do. That's valuable information. Now you know where you are.

Prioritize Your Gaps Based on Impact and Feasibility

Not all gaps are equally important. Not all problems need to be solved immediately. Use this prioritization framework:

Address immediately if:

- The gap creates critical risk (security, compliance, financial)
- The gap is actively causing organizational dysfunction
- The gap prevents other improvements from being effective
- You have the authority and resources to address it

Address soon (next 90–180 days) if:

- The gap limits organizational performance
- The gap affects employee satisfaction or retention
- The gap impacts business relationships
- Addressing it builds momentum for larger changes
- You need to build capability before tackling bigger issues

Address later (6–12 months) if:

- The gap is a nice-to-have rather than essential
- Other gaps need to be addressed first for this to be effective
- You need to build organizational readiness
- Resources aren't currently available but will be
- It requires prerequisites you're working on now

Consider not addressing if:

- The gap doesn't significantly impact your mission
- Addressing it provides minimal value relative to effort
- You don't have authority to fix the underlying issue
- It's a symptom of a different problem you should address instead

This prioritization means being strategic with limited resources and building systematically rather than trying to fix everything at once.

Sequence Your Work Based on Dependencies

Here's a general sequence that respects the integrated nature of the framework:

First 6 Months:

- Continue developing your leadership capability (Module 1 - ongoing)
- Address critical organizational health issues (Module 2 - leadership team, structure, critical capabilities)
- Establish or strengthen governance (Module 3 - Section 3.1)
- Fix urgent service delivery problems (Module 4 - critical issues only)

Months 6–12:

- Build out remaining organizational health elements (Module 2 - culture, communications)
- Develop strategic planning capability (Module 3 - Section 3.2)
- Establish systematic service management (Module 4 - processes and frameworks)
- Begin building feedback and improvement culture (Module 5 - Section 5.1)

Months 12–18:

- Mature governance and strategy (Module 3 - all sections)
- Elevate service excellence (Module 4 - all sections)
- Implement systematic improvement (Module 5 - Sections 5.2–5.3)

Months 18–24:

- Refine and optimize all areas
- Implement performance management (Module 5 - Section 5.4)
- Build innovation capability (Module 5 - Section 5.5)
- Focus on continuous improvement across all modules

This is a general path. Your specific situation may require different sequencing. Focus on understanding dependencies, don't try to implement advanced strategic planning if you don't have basic governance in place. Don't try to build innovation capability if your culture punishes failure. Don't try to achieve service excellence if your organizational structure prevents it.

What to Expect

This is what you're signing up for:

This will take years, not months. You'll make progress in some areas while other areas slide backward. You'll have wins that energize your team and setbacks that make you question whether it's worth it. You'll get resistance from people who prefer the old way, even when the old way wasn't working. You'll face budget cuts, political changes, staff turnover, and unexpected crises that derail your plans.

Some days you'll feel like you're building something significant. Other days you'll feel like you're pushing a boulder uphill. Both feelings are valid. This is the nature of organizational transformation.

You'll also discover something interesting: as you build capability in one area, it makes other areas easier. Strong leadership makes organizational health work easier, which in turn makes strategic alignment more natural. That alignment feeds into service excellence, which builds the trust you need for innovation. And innovation circles back to strengthen the whole system.

The approach creates positive reinforcement loops. But you have to build enough of the system for those loops to kick in, and that's why the early work is the hardest. You're investing before you see real returns.

What Success Looks Like

Three to five years from now, if you do this work consistently, you'll likely see:

Your IT organization will have clarity of purpose. People will understand not just what they do, but why it matters. They'll see how their work connects to larger outcomes.

Your team will be healthier. You'll retain good people and attract strong candidates. People will be engaged rather than just employed. They'll take ownership rather than just follow orders.

Your business partners will view IT differently. You'll be invited to strategic conversations earlier. Departments will see you as partners rather than vendors. Elected officials will trust your judgment. You'll have the relationships and credibility to do more significant work.

Your services will be more reliable and valuable. Not perfect, nothing in government IT is perfect, but noticeably better. Problems will get solved faster. Projects will deliver what people need. Your service portfolio will align with organizational priorities.

Your organization will have capabilities you don't have now, handling ambiguity, adapting to change, solving problems systematically, pushing boundaries on what's possible. These compound over time.

You'll be able to answer questions like that one my CEO asked me: "How do you know this is performing well?" Because you'll have built the systems to know. And you'll have built the connections so performance in one area clearly links to value in another.

It doesn't mean you'll have unlimited resources or no constraints. Local government IT will still be local government IT. But you'll be working from a position of organizational strength rather than constantly scrambling to keep up.

Why This Matters Beyond Your IT Department

Remember that CIO who asked me at the conference how an organization our size did what we were doing? That question wasn't really about technology. It was about impact.

Local government IT is not about servers and software. It's about enabling your organization to serve your community well. Making it easier for residents to interact with their government, helping departments work more efficiently, supporting elected officials in making informed decisions. And it's about protecting public resources and public trust.

When your IT organization is high-performing, not perfect, but consistently capable and improving, it multiplies everything your government does. Permits get processed faster. Public safety responds more effectively. Public works maintains infrastructure more efficiently. Finance manages resources more transparently. Every department you support serves the community better because you're serving them better.

This framework exists because local government matters. The work you do matters. The communities you serve matter. And you deserve tools and frameworks that help you do this work well rather than constantly struggling.

Too many talented IT leaders burn out or give up because they're trying to build something without a map. They know something needs to change but don't know where to start or how the pieces fit together. They make progress in one area only to discover it's undermined by problems in another area they didn't address.

The HPG-IT Framework gives you the map. It shows you the whole system. It helps you understand where you are and what you need to build. It provides practical action plans for each area. It gives you assessment tools to measure progress. It offers an approach that respects the reality of local government IT while calling you toward something better.

You're More Capable Than You Think

When I look back at that conversation with my CEO about our department's performance, I'm grateful for it. It wasn't comfortable. But it pushed me to think more systematically about how everything connects.

You know what I realized later? I had all the pieces in place to answer his question well. I just hadn't consciously connected them yet. The governance structure gave us the authority to make changes. The strategic alignment showed which outcomes mattered most. The service metrics told us how we were performing. The improvement systems gave us the means to get better. The pieces were there. I just needed to see how they fit together.

You have more capability than you think you do. You have more resources than you realize. You have more influence than you're currently using. What you might be missing is the framework that helps you see how everything connects and how to build systematically.

That's what this book provides.

The Challenge Ahead

Building a high-performing government IT organization is difficult work. It requires ongoing effort, personal growth, and a willingness to make hard decisions. You'll need patience when you want quick results, courage to address uncomfortable issues, and enough humility to acknowledge what you don't know.

But here's what I've learned after years of working with IT leaders across the country: you're capable of this work. Your team is capable of this work. Your organization is capable of this work.

The question isn't whether you can do this. It's whether you will. Whether you'll stick with it when the work gets hard, keep building when progress feels slow, and trust the process before the results show up.

Most IT leaders quit too early. They start implementing changes, hit resistance or setbacks, and retreat to what's comfortable. They try to build organizational health without doing their own leadership development work first. They implement frameworks without addressing the cultural issues that prevent frameworks from working. They chase technology trends instead of building systematic capability.

Don't be most IT leaders. Be the one who does the work. Be the one who builds systematically. Be the one who creates an IT organization that performs at a high level over sustained periods.

Your community is counting on you, even if they don't know it. Your team is counting on you. Your customers are counting on you. And you're capable of delivering for them.

Coming Full Circle

Remember that CIO at the conference who asked how an organization our size did what we were doing? I didn't have a good answer for him then. I just knew something was different about how we approached the work.

Now I can answer that question clearly: we covered the major areas that mattered. We had a structure, even if we didn't call it that at the time. We weren't excellent at everything, we had gaps everywhere. But we had enough of the right pieces in place, and they reinforced each other.

That's what you're building with the HPG-IT Framework. Not perfection. Not excellence in every area simultaneously. Just enough of the right pieces, implemented well enough, reinforcing each other systematically.

You don't need to be smarter than your peers. You don't need more resources than comparable organizations. You don't need to be more innovative or more technically skilled. You need to build systematically. You need to cover the major

areas. You need to create connections. You need to keep building even when it's hard.

That's what high-performing government IT organizations do. And now you have the framework to do it too.

The Work Is Continuous

One final truth: you never complete this framework. Your organization is never "done."

Leadership development is ongoing. Organizational health requires constant attention. Strategic alignment shifts as your organization's priorities evolve. Service excellence is a moving target as expectations and technologies change. Continuous improvement is literally in the name, it never stops.

But that's not a bug. That's a feature.

This approach isn't designed to get you to a finish line so you can stop working. It's designed to give you the systems and capabilities to keep getting better indefinitely. It's designed to make the ongoing work more effective and less exhausting.

The organizations that last are the ones that treat every change as raw material, something to learn from and build on. They don't just weather challenges, they come out of them stronger and more capable.

It has always been about this. Not reaching some perfect end state, but building the organizational capability to keep learning, keep adapting, keep improving, and keep delivering value to the communities you serve.

The work begins. And it never really ends. But it gets better. You get better. Your team gets better. Your organization gets better. And your community benefits from everything you've built.

That's worth the work.

Now go build something that matters.

COMPANION READING:

The ideas in this book grew out of years of reading across leadership, public administration, IT management, and organizational behavior. Some of those books shaped how I think about specific topics. Some I return to every few years and still find new things in. A few changed the work for me.

I've put together a curated reading list of those books and resources, organized by the topics covered in this manuscript. If you want to go deeper on governance, or service management, or the human side of leading IT, the list points you to the sources that helped me the most. I update it regularly.

It's free. No sign up, no email required, no gimmicks.

APPENDIX A

THE FIELD GUIDE

Working Documents, Assessments, and Implementation Plans

This appendix consolidates the working documents, self-assessments, and implementation plans that accompany the framework. Each entry references its source section. Use these standalone, or alongside the section as you read.

I've also put together a DOCX version of this appendix to edit and work with. It's free. Email registration is required.

www.stevemonaghan.com

A.1 Module 1 Working Documents: Being a Government IT Leader

A.1.1 Section 1.1: Purpose and Role Inventory

Purpose and Role Inventory
Use this worksheet to do the honest work Section 1.1 asks of you. Not the mission statement version. The real one.

Part 1: Describe Your Current Role
When someone outside IT asks you what you do, what do you say? Write it the way you actually say it, not the way it sounds in a job description. [your answer]
Now look at what you wrote. Count the activity words (implement, manage, maintain, secure, deploy) and the outcome words (enable, serve, deliver, support). Which list is longer?
Activity-heavy: [yes / no]
Outcome-heavy: [yes / no]

Part 2: Identify the Purity Trap Signals
Section 1.1 names five signals that you may have drifted from purpose into purity. Rate each from 1 to 5 (1 = rarely true, 5 = frequently true).
[ ] My team and I often feel like the organization is the problem.
[ ] I frequently say "they don't understand IT" or "they don't understand the constraints."
[ ] I find myself defending IT decisions more often than exploring stakeholder needs.
[ ] My customers are chronically frustrated with IT, and I attribute it to their lack of understanding.
[ ] I take more pride in following the framework correctly than in the outcome the framework produced.
Total: [ ] / 25

Scoring:
20–25: You may be deep in the purity trap. Section 1.1's reframe is essential before any other work.
15–19: You are at risk. Notice when you start to defend rather than explore.
10–14: You are aware of the tension. Keep checking yourself.
Below 10: You are likely operating from purpose, not purity. Use the rest of the framework to deepen what is working.

Part 3: Rediscover Your Real Role
Complete each prompt in your own words. One or two sentences each.
The community my organization serves is: [your answer]

The way my organization serves that community is: [your answer]
The way technology helps my organization do that work better is: [your answer]
The two or three places where I can make the biggest difference this year are: [your answer]

Part 4: A Conversation You Need to Have
Section 1.1 turns on a conversation. A CIO is asked to describe her role, and she answers in frameworks. Then she is asked why those frameworks matter, and she pauses.
Find one trusted peer in the next thirty days and ask them to do the same thing to you. Have them ask you what your role is, and then have them ask you why that matters. Pay attention to where you pause.
Peer I will ask: [name]
By when: [date]
What I noticed when asked: [to complete after the conversation]

A.1.2 Section 1.2: Time Audit and Reclamation Plan

Time Audit and Reclamation Plan
Section 1.2 asks how much of your time goes to strategic leadership work versus operational firefighting. This worksheet helps you answer that question with data and then make a concrete plan to shift the balance.

Part 1: One-Week Time Audit
For one week, log every block of time on your calendar in one of these three categories.
Category A: Strategic Leadership Work
One-on-ones with team members. Vision and culture work. Strategy and governance. Coaching and development. Thinking time.
Category B: Operational and Reactive Work
Crisis response. Vendor escalations. Routine status meetings. Approvals and signoffs. Email and chat that requires immediate response.
Category C: Low-Value Activity
Meetings that did not need you. Reports nobody read. Tasks that could have been delegated.
End-of-week totals:
Category A: [ ] hours, [ ] percent | Category B: [ ] hours, [ ] percent | Category C: [ ] hours, [ ] percent
What you wish the percentages were:
Category A: [ ] percent | Category B: [ ] percent | Category C: [ ] percent (target zero)

Part 2: Identify the One Thing

Section 1.2 says: do not try to flip your calendar overnight. Pick one thing. One area where your time would make the biggest difference right now.
The one strategic leadership activity I will protect time for, starting now: [your answer]
Why this one, not another: [your answer]
How much time per week I will protect for it:
[ ] hours
What recurring meeting or activity I will decline or delegate to make room for it: [your answer]

Part 3: The Reclamation Plan

Immediate Actions (This Week):
Block the time on your calendar. Treat it like a critical system outage. Tell your direct reports it is protected.
Identify three meetings on next week's calendar where you are not the decision-maker and decline at least one.
Send one delegation email this week handing off a task you have been doing because it is faster than teaching someone else to do it.

Short-Term (This Month):
Establish or restore a recurring one-on-one rhythm with each direct report. Weekly or bi-weekly. Real conversations, not status updates.
Identify the two or three executive stakeholders you should be meeting with regularly. Schedule the first one.
Track your time again at the end of the month. Did the percentages move?

Medium-Term (This Quarter):
Build a regular leadership-team rhythm focused on long-term work, not status. Use Section 1.2's prompts on what leadership team meetings should accomplish.
Identify one operational area where your team's structure or process is forcing escalation to you that should be resolved at a lower level. Fix the structure, not the symptom.
Conduct a culture audit. What are the values you want to see in the organization? Where are you actively reinforcing them? Where are you not?

Long-Term (This Year):
Build management-by-walking-around into your weekly rhythm. Get out of your office regularly.
Establish a recurring all-staff meeting if you do not already have one.
At the one-year mark, repeat the Part 1 time audit. The percentages should look different. If they do not, the rest of this framework cannot do its work.

Part 4: The Three Pillars Self-Check

Rate yourself honestly. 1 = work to do, 5 = strong.
[ ] Self-awareness. I understand my strengths, my limits, and how I affect others.
[ ] Team building. I am building a cohesive team aligned on a shared vision.
[ ] Self-control. I manage my emotions and impulses, especially under stress.
Total: [ ] / 15
Whichever pillar is lowest is the one to work on first.

A.1.3 Section 1.3: Core Leadership Principles and Competencies Inventory

Core Leadership Principles and Competencies Inventory
Use this worksheet to do the inventory Section 1.3 calls for. Three parts. The first two are private. The third is the one that makes the work real.

Part 1: My Core Leadership Principles
What do you actually believe about how leadership should work? Not what's in the textbooks. What you've come to believe from doing the work. Write five.
1. [your answer]
2. [your answer]
3. [your answer]
4. [your answer]
5. [your answer]
Now read them back. Cross out any that sound like things you think a leader is supposed to say but don't actually believe. Rewrite anything that does not survive that test.

Part 2: Competency Self-Assessment
Rate yourself honestly on each of these. 1 = significant gap, 5 = real strength. Be the version of yourself that would tell you the truth.
Technical and analytical:
[ ] Strategic thinking and pattern recognition
[ ] Technology judgment under uncertainty
[ ] Reading data, identifying signal from noise
Relational and people:
[ ] Building trust with peers outside IT
[ ] Coaching and developing direct reports
[ ] Hard conversations (giving feedback, calling out behavior)
[ ] Listening to understand before responding
Organizational and political:
[ ] Reading the room
[ ] Building political capital across departments
[ ] Aligning IT priorities to executive priorities
[ ] Communicating IT value in language non-IT people care about

Total ratings of 1 or 2: [ ]
Total ratings of 4 or 5: [ ]

Part 3: The Uncomfortable Truth Identification
Section 1.3 names a pattern: the competencies you most need to develop are often the ones you least want to acknowledge. Look at your low ratings. One of them is the right place to start. Probably the one you most wanted to argue with.
The competency I rated lowest that I am most resistant to working on: [your answer]
What working on this competency might look like over the next ninety days (one specific action, not a vague goal): [your answer]
Who I will tell about this commitment, so it becomes real: [your answer]

Part 4: The Self-Awareness Check
Pick three people who have worked closely with you over the past year. One direct report, one peer, one stakeholder outside IT. Ask each of them: "What is one thing I do that helps you work effectively, and one thing I do that gets in the way?"
You do not need to defend yourself. Just listen. Write down what you hear.
Direct report I will ask: [name]
Peer I will ask: [name]
Stakeholder I will ask: [name]
By when: [date]
What I heard that confirmed what I already knew: [to complete after the conversations]
What I heard that surprised me: [to complete after the conversations]
What I will do differently because of this: [to complete after the conversations]

A.1.4 Section 1.4: Political Navigation Development Plan

Political Navigation Development Plan

Assess Your Current State:

- Map your key stakeholder relationships on a scale of 1–5 (1=adversarial, 5=strong partnership)
- Identify which relationships most need development
- Evaluate your political capital balance: Are you building more than you're spending?

Build Relationship Infrastructure:

- Schedule regular one-on-ones with your County Executive/City Manager
- Establish quarterly coffee meetings with each department head
- Attend board meetings regularly (not just when IT items are on the agenda)
- Create opportunities for informal interaction with elected officials

Develop Political Intelligence:

- Identify the informal influencers in your organization
- Understand what each key stakeholder is measured on
- Learn the political dynamics between major players
- Pay attention to who influences whom

Practice Adaptive Communication:

- Study the decision-making style of each key stakeholder
- Prepare materials in formats that work for different audiences
- Practice translating technical concepts into business language
- Seek feedback on how your communication is received

Build Political Capital:

- Deliver quick wins that stakeholders care about
- Say yes strategically to high-visibility requests
- Share credit generously
- Be visible and accessible
- Support others' initiatives when you can

Monitor and Adjust:

- Quarterly review: Are relationships improving?
- Track initiative success rates, are things progressing?
- Seek feedback: Ask trusted advisors how you're perceived
- Adjust approach based on what's working

A.1.5 Section 1.5: Communication Development Plan

Communication Development Plan

Immediate Actions (This Week):

- Schedule recurring one-on-ones with each direct report (weekly or bi-weekly)
- Identify your three most important business partners and schedule time with each
- Before your next major communication, ask: "What does this audience care about? How should I adapt my message?"

Short-Term Development (This Month):

- Conduct a communication audit: track how you spend communication time for one week
- Seek feedback: ask three trusted people "How would you describe my communication style? What could I do better?"

- Practice active listening: in your next five conversations, focus entirely on understanding before responding
- Create a collection of stories that illustrate your vision and values

Medium-Term Building (This Quarter):

- Establish regular communication rhythms (weekly team meetings, monthly all-staff, quarterly board updates)
- Develop audience profiles: for each key audience, document what they care about and how to communicate effectively with them
- Create feedback mechanisms: implement at least one new way for people to give you input
- Measure communication effectiveness: survey your team on clarity of priorities, vision understanding, feeling heard

Long-Term Mastery (This Year):

- Develop storytelling capability: collect and refine stories for different purposes
- Build communication infrastructure (covered in Module 2, Section 2.6)
- Establish yourself as a clear, consistent communicator known for creating connections
- Mentor others in communication skills, teaching is the best way to master them

A.1.M Module 1: Self-Assessment and Development Plan

From Module 1: Summary.

Your Leadership Foundation Development Plan
Use this template to create your personal development plan for the next 90 days:

MODULE 1 SELF-ASSESSMENT: LEADERSHIP FOUNDATION

Instructions
Rate yourself honestly on each statement using this scale:

- 1 = Not at all true for me currently
- 2 = Rarely true
- 3 = Sometimes true
- 4 = Often true
- 5 = Consistently true

This assessment helps identify your leadership development priorities. The goal isn't scoring 5 on everything. It's knowing where to focus.

Section 1.1: Purpose and Role (5 statements)

[ ] 1. I can clearly articulate how my role serves organizational mission, not just IT operations

[ ] 2. My business conversations feel collaborative rather than defensive

[ ] 3. I regularly evaluate IT standards and practices based on organizational needs rather than technical purity

[ ] 4. Department heads see me as an organizational partner, not just the technology person

[ ] 5. I spend more time enabling organizational success than defending IT decisions

Section 1.1 Score: [score] / 25

Section 1.2: Time Prioritization (5 statements)

[ ] 1. I spend at least 30% of my time on strategic leadership work rather than operational tasks

[ ] 2. I block protected time on my calendar for strategic thinking and relationship-building

[ ] 3. I regularly have unhurried conversations with each member of my leadership team

[ ] 4. I have declined or delegated meetings that don't require my direct involvement

[ ] 5. My team can operate effectively without me for at least two weeks

Section 1.2 Score: [score] / 25

Section 1.3: Self-Awareness and Competencies (5 statements)

[ ] 1. I have received honest, critical feedback about my leadership within the past year

[ ] 2. I can identify my leadership behaviors under stress that undermine my effectiveness

[ ] 3. I have an active development plan for my weakest leadership competency

[ ] 4. I have a professional network of peers who will tell me hard truths

[ ] 5. I regularly seek and act on feedback from my team about my leadership impact

Section 1.3 Score: [score] / 25

Section 1.4: Ambiguity and Politics (5 statements)

[ ] 1. I can name the three most influential people in my organization and have working relationships with each

[ ] 2. I invest meaningful time in relationship-building with key decision makers

[ ] 3. I can handle political dynamics without compromising my integrity

[ ] 4. When faced with ambiguity, I work through it effectively rather than freezing or forcing premature decisions

[ ] 5. Conflicts in my sphere get resolved constructively rather than avoided or escalated

Section 1.4 Score: [score] / 25

Section 1.5: Communication (5 statements)

[ ] 1. I adapt my communication style based on audience needs rather than defaulting to one approach

[ ] 2. Every member of my team can articulate the organization's top three priorities

[ ] 3. People feel safe giving me honest feedback

[ ] 4. I spend more time listening than talking in important conversations

[ ] 5. I regularly communicate the "why" behind decisions, not just the "what"

Section 1.5 Score: [score] / 25

Total Module 1 Score: [score] / 125

Interpreting Your Scores

- 100–125: Strong leadership foundation. Focus on refinement and mentoring others.
- 75–99: Solid base with growth areas. Pick your 1–2 weakest sections for focused development.
- 50–74: Significant development needed. Consider executive coaching and prioritize Module 1 before advancing to other modules.
- Below 50: Leadership foundation needs urgent attention. This module should be your primary focus for the next 90 days.

My Top Priority Leadership Competency to Develop:

Why this matters for my success:

Specific actions I will take:

1. [your answer]
2. [your answer]
3. [your answer]

Resources I need (training, coaching, books, mentors):

How I will measure progress:

Accountability partner who will check on my progress:

Monthly check-in dates:

- Month 1: [your answer]
- Month 2: [your answer]
- Month 3: [your answer]

A.2 Module 2 Working Documents: Building a Healthy Organization

A.2.1 Section 2.1: Leadership Team Development Exercise

Leadership Team Development Exercise

Team Health Assessment:
Rate your leadership team on each dimension (1=Poor, 5=Excellent):

- Shared understanding of vision and priorities: [ ]
- Trust and psychological safety: [ ]
- Clear roles with shared accountability: [ ]
- Early, transparent communication: [ ]
- Collective decision-making with full commitment: [ ]
- Mutual accountability: [ ]
- Models desired organizational culture: [ ]

Average Score: [score]
Development Priority: Based on your lowest scores, what's the ONE area you'll focus on improving in the next 90 days?

Specific Actions:
1. [your answer]
2. [your answer]
3. [your answer]

A.2.2 Section 2.2: Vision and Purpose Development Exercise

Vision and Purpose Development Exercise

Discovering Purpose:
Complete these prompts:

- When IT works well in our organization, it enables: [your answer]
- The people who benefit most from our work are: [your answer]
- If we stopped doing our jobs, this is what would break down: [your answer]
- Our work matters because: [your answer]

Crafting Vision:
In 3–5 years, we will be an IT organization where:
1. Stakeholders experience us as: [your answer]
2. Our team members feel: [your answer]
3. Our systems and services are characterized by: [your answer]
4. We're recognized for: [your answer]

Defining Values:

What behaviors do we want to see MORE of? [your answer]
What behaviors do we want to see LESS of? [your answer]
What values would drive those desired behaviors? [your answer]

Communication Plan:
How will I communicate vision and purpose in the next 30 days?

- To my leadership team: [your answer]
- To my full IT staff: [your answer]
- To key stakeholders: [your answer]
- Through storytelling: [your answer]

A.2.3 Section 2.3: Organizational Structure Assessment

Organizational Structure Assessment Exercise

Structure Alignment Check:
Rate how well your structure enables these capabilities (1=Poor, 5=Excellent):

- Supporting your strategic priorities: [ ]
- Coordinating cross-functional work: [ ]
- Enabling appropriate decision-making: [ ]
- Providing clear accountability: [ ]
- Building stakeholder relationships: [ ]
- Developing staff capability: [ ]

Average Score: [score]

Gap Analysis:
Where is work consistently falling through cracks? [your answer]
Where are people duplicating effort? [your answer]
Where are decisions getting stuck? [your answer]
Where is coordination consistently difficult? [your answer]

Improvement Actions:
Based on your gaps, what structural improvements (short of reorganization) could address them?
1. [your answer]
2. [your answer]
3. [your answer]

A.2.4 Section 2.4: Capability Development Planning Exercise

Capability Development Planning Exercise

Organizational Capability Assessment:
List your top 5 capability needs for the next 2–3 years:

1. [your answer]
2. [your answer]
3. [your answer]
4. [your answer]
5. [your answer]

Current State: For each capability above, do you have it internally? If yes, in how many people? If no, what's your plan to build or acquire it?

Succession Planning:

For each critical role, answer:

- Who could step in tomorrow if needed? [your answer]
- Who could be ready in 12 months with development? [your answer]
- What development do they need? [your answer]

Individual Development Plans:

For each of your direct reports:

- What capabilities are they developing this year? [your answer]
- What opportunities are you creating? [your answer]
- How are you supporting their development? [your answer]

Culture Check:

How many hours per month does each person spend on professional development?
Is that adequate for staying current in your field?
What obstacles prevent more development time?

A.2.5 Section 2.5: Culture Assessment Exercise

Culture Assessment Exercise

Current Culture Health Check:

Rate your organization on each element (1=Poor, 5=Excellent):

- Psychological safety (people feel safe raising concerns and admitting mistakes): [ ]
- Trust and respect in interpersonal interactions: [ ]
- Collaboration across boundaries: [ ]
- Continuous learning orientation: [ ]
- Clear accountability and high standards: [ ]
- Regular recognition and appreciation: [ ]

Average Score: [score]

Culture Behaviors Analysis:

List 3 behaviors you want to see MORE of:
1. [your answer]

2. [your answer]
3. [your answer]

List 3 behaviors you want to see LESS of:

1. [your answer]
2. [your answer]
3. [your answer]

Your Culture Leadership:

How are you currently modeling the culture you want? [your answer]
What culture-killing behaviors are you tolerating? [your answer]
What will you do differently this week to shape culture? [your answer]

A.2.6 Section 2.6: Communication System Design Exercise

Communication System Design Exercise

Current State Assessment:

List your current regular communication forums:

- Frequency: [your answer]
- Audience: [your answer]
- Purpose: [your answer]
- Effectiveness (1–5): [your answer]

Gaps to Address:

What information doesn't reliably reach the people who need it? [your answer]
Where are you hearing "I didn't know about that" too often? [your answer]
What upward communication channels are missing or ineffective? [your answer]

System Design:

For the next 90 days, commit to:

Downward communication:

- What: [your answer]
- Who: [your answer]
- Channel: [your answer]
- Frequency: [your answer]

Upward communication:

- What mechanism will you create/strengthen? [your answer]
- How will you demonstrate responsiveness to input? [your answer]

Cross-functional communication:

- What will you do to break down silos? [your answer]

A.2.M Module 2: Self-Assessment and Action Plan

From Module 2: Summary.

Your Organizational Health Development Plan

Use this template to create your action plan for the next 90 days:

My Top Priority Area (from self-assessment):

Why this matters most right now:

Specific actions I will take:

In the next 30 days:

1. [your answer]
2. [your answer]
3. [your answer]

In 30–60 days:

1. [your answer]
2. [your answer]
3. [your answer]

In 60–90 days:

1. [your answer]
2. [your answer]
3. [your answer]

Resources I need:

- Time investment: [your answer]
- Budget: [your answer]
- Support from others: [your answer]
- Training/development: [your answer]

How I will measure progress:

Accountability mechanism:

- Partner: [your answer]
- Check-in schedule: [your answer]

Monthly Review Dates:

- Month 1: [your answer] (Assess progress, adjust approach)
- Month 2: [your answer] (Assess progress, adjust approach)
- Month 3: [your answer] (Complete 90-day review, plan next phase)

MODULE 2 SELF-ASSESSMENT: ORGANIZATIONAL HEALTH

Instructions

Rate your organization honestly on each statement using this scale:

1 = Not at all true for our organization currently

2 = Rarely true

3 = Sometimes true

4 = Often true

5 = Consistently true

This assessment helps you figure out where to focus your organizational health work. The goal isn't scoring 5 on everything. It's knowing where to focus.

Section 2.1: Your Leadership Team (5 statements)

[ ] 1. My leadership team has shared understanding of our vision and top priorities

[ ] 2. Team members trust each other and feel psychologically safe raising concerns

[ ] 3. We have clear roles and responsibilities that don't create gaps or overlaps

[ ] 4. We make decisions together when appropriate and commit fully even when we disagree

[ ] 5. The leadership team models the culture we want in the broader organization

Section 2.1 Score: [score] / 25

Section 2.2: Vision and Purpose (5 statements)

[ ] 1. We have a clear, compelling vision that people can articulate in their own words

[ ] 2. Every team member can explain why their work matters beyond technical tasks

[ ] 3. Our stated values are lived in daily decisions and behaviors

[ ] 4. People understand how their work connects to organizational mission

[ ] 5. Decisions are evaluated against whether they advance our vision

Section 2.2 Score: [score] / 25

Section 2.3: Organizational Structure (5 statements)

[ ] 1. Roles and responsibilities are clear; people know who owns what

[ ] 2. Decision authority is explicit; people know what they can decide autonomously

[ ] 3. Reporting relationships and spans of control are appropriate

[ ] 4. We have effective mechanisms for coordinating cross-functional work

[ ] 5. Our structure enables our strategy rather than working against it

Section 2.3 Score: [score] / 25

Section 2.4: Capabilities and People (5 statements)

[ ] 1. We invest meaningfully in professional development

[ ] 2. People have clear career paths and understand how to progress

[ ] 3. We're actively developing people for future leadership roles

[ ] 4. Performance management provides regular, meaningful feedback for growth

[ ] 5. High performers receive recognition and development opportunities

Section 2.4 Score: [score] / 25

Section 2.5: Culture and Environment (5 statements)

[ ] 1. People feel psychologically safe admitting mistakes and raising concerns

[ ] 2. Collaboration across boundaries happens naturally

[ ] 3. We learn from both successes and failures systematically

[ ] 4. Clear accountability exists without blame or defensiveness

[ ] 5. The gap between our stated values and lived values is small

Section 2.5 Score: [score] / 25

Section 2.6: Communications (5 statements)

[ ] 1. People receive the information they need to do their jobs effectively

[ ] 2. Everyone understands organizational priorities and major decisions

[ ] 3. Information flows upward from staff to leadership effectively

[ ] 4. Communication happens through consistent, reliable channels and rhythms

[ ] 5. People have opportunities to provide input and feel heard

Section 2.6 Score: [score] / 25

Total Module 2 Score: [score] / 150

Interpreting Your Scores

120–150: Strong organizational health. Focus on refinement and sustaining what you've built.

90–119: Solid base with growth areas. Pick your 1–2 weakest pillars for focused development.

60–89: Significant development needed. Prioritize leadership team and culture before advancing to Module 3.

Below 60: Organizational health needs urgent attention. This module should be your primary focus for the next 90 days.

My Top Priority Organizational Health Area to Develop:

Why this matters for my organization's success:

Specific actions I will take:

1. [your answer]

2. [your answer]

3. [your answer]

Resources I need:

How I will measure progress:

Accountability mechanism:

Monthly check-in dates:

Month 1: [your answer] | Month 2: [your answer] | Month 3: [your answer]

Before You Move to Module 3:

- Complete the self-assessment honestly
- Identify your top 1–2 priority areas
- Create your 90-day action plan
- Share with your leadership team and get their commitment
- Begin implementation immediately
- Schedule quarterly re-assessment

A.3 Module 3 Working Documents: Working on the Right Stuff

A.3.1 Section 3.1: IT Governance Assessment

IT Governance Assessment Exercise

Current State Assessment:

Rate your organization on each governance dimension (1=Absent, 5=Excellent):

- We have formal governance structures with clear purpose and membership: [ ]
- Governance bodies meet regularly and make real decisions: [ ]
- We use clear, documented criteria for prioritizing work: [ ]
- Governance decisions are enforced and followed through: [ ]
- People trust that governance is fair and transparent: [ ]
- We have appropriate balance between strategic oversight and tactical agility: [ ]
- Portfolio status and capacity constraints are visible to stakeholders: [ ]

Average Score: [score]

Interpretation:

- **4.0–5.0:** Strong governance foundation, focus on optimization and continuous improvement
- **3.0–3.9:** Basic governance in place, strengthen processes and build maturity
- **2.0–2.9:** Significant gaps, prioritize building governance structures
- **1.0–1.9:** Critical need, start with basic two-tier structure immediately

Your Governance Development Plan:

Based on your assessment, what's your priority?

If starting from scratch (scores below 2.5):

Next 30 days:

- [ ] Secure executive sponsorship for governance
- [ ] Define IT Governance Council membership
- [ ] Schedule first Council meeting
- [ ] Draft charter and decision-making criteria

Next 60 days:

- [ ] Hold first Council meeting with real decisions
- [ ] Establish IT Governance Working Group

- [ ] Create project request template
- [ ] Begin monthly Working Group meetings

Next 90 days:

- [ ] Review first quarter effectiveness
- [ ] Adjust processes based on learning
- [ ] Document decisions and build portfolio visibility
- [ ] Communicate governance process to broader organization

If strengthening existing governance (scores 2.5–3.5):
What's working: [your answer]
What needs improvement: [your answer]
Specific actions: [your answer]

If optimizing mature governance (scores above 3.5):
What could be more efficient: [your answer]
What decisions could be pushed down: [your answer]
How to increase strategic value: [your answer]

A.3.2 Section 3.2: Strategic Planning Development Exercise

Strategic Planning Development Exercise

If you don't have a strategic plan:
Create a simplified version to start:

Our 3 Strategic Goals:

1. [your answer]
2. [your answer]
3. [your answer]

Our Top 5 Strategic Initiatives:

1. [your answer]
2. [your answer]
3. [your answer]
4. [your answer]
5. [your answer]

Next steps to formalize:

- Secure executive sponsorship: [your answer]
- Conduct stakeholder input: [your answer]
- Develop full plan: [your answer]
- Target completion date: [your answer]

If you have a strategic plan but it's not being used:

Why isn't it being used?

- Not communicated well: [your answer]
- Disconnected from day-to-day work: [your answer]
- Too ambitious/unrealistic: [your answer]
- Overtaken by events: [your answer]

Actions to revitalize:

1. [your answer]
2. [your answer]
3. [your answer]

If you have an active strategic plan:

How well is it working?

- Strategic goals still relevant: [your answer]
- Initiatives on track: [your answer]
- Stakeholder awareness and support: [your answer]
- Connection to governance and budget: [your answer]

Improvements needed:

1. [your answer]
2. [your answer]

A.3.3 Section 3.3: Frameworks and Standards Assessment

Frameworks and Standards Assessment Exercise

Current State Assessment:

Rate your organization on each dimension (1=Absent, 5=Excellent):

- We use NIST CSF to assess, communicate, and improve security posture: [ ]
- We have effective Incident, Change, and Problem Management processes: [ ]
- We have clear, documented technology standards that are followed: [ ]
- We have basic data governance with clear ownership and accountability: [ ]
- We have architecture principles that guide technology decisions: [ ]
- Our frameworks add value without creating excessive bureaucracy: [ ]
- We regularly review and adjust frameworks based on experience: [ ]

Average Score: [score]

Interpretation:

- **4.0–5.0:** Strong foundation, focus on optimization and evolution
- **3.0–3.9:** Basic frameworks in place, strengthen and mature

- **2.0–2.9:** Significant gaps, prioritize building groundworks
- **1.0–1.9:** Critical need, start with highest-value frameworks

Your Development Priorities:
Based on your assessment, what are your top 1–2 framework/standard priorities?

Priority 1: [your answer]

Why it matters: [your answer]

Next steps: [your answer]

Resources needed: [your answer]

Target implementation date: [your answer]

Priority 2: [your answer]

Why it matters: [your answer]

Next steps: [your answer]

Resources needed: [your answer]

Target implementation date: [your answer]

A.3.4 Section 3.4: Services and Products Alignment + Service Catalog Quick-Start Plan

Services and Products Alignment Assessment Exercise

Current State Assessment:
Rate your organization on each dimension (1=Poor, 5=Excellent):

- We have published service catalog that customers can easily access: [ ]
- Customers understand what IT offers and how to request services: [ ]
- We regularly engage customers to understand their needs and priorities: [ ]
- Customers participate meaningfully in selecting services IT provides: [ ]
- End-users participate in evaluating and selecting products they'll use: [ ]
- We communicate technology lifecycles and planned replacements transparently: [ ]
- We operate as partners with customers, not just service providers: [ ]

Average Score: [score]

Interpretation:

- **4.0–5.0:** Strong alignment, focus on continuous improvement
- **3.0–3.9:** Basic alignment, strengthen customer partnership
- **2.0–2.9:** Significant gaps, prioritize building alignment practices
- **1.0–1.9:** Critical misalignment, fundamental shift needed

Your Development Priorities:
Based on your assessment, what are your top 1–2 priorities for improving alignment?

Priority 1: [your answer]

Why it matters: [your answer]

First steps: [your answer]

Success measure: [your answer]

Priority 2: [your answer]

Why it matters: [your answer]

First steps: [your answer]

Success measure: [your answer]

Service Catalog Quick-Start Plan:
If you don't have service catalog, create basic version:

Top 10 services to document first:

1. [your answer]
2. [your answer]
3. [your answer]
4. [your answer]
5. [your answer]
6. [your answer]
7. [your answer]
8. [your answer]
9. [your answer]
10. [your answer]

Where we'll publish it: [your answer]

Who owns maintaining it: [your answer]

Target completion date: [your answer]

How we'll promote it to customers: [your answer]

A.3.5 Section 3.5: Budget and Financial Management Assessment

Budget and Financial Management Assessment Exercise

Current State Assessment:
Rate your organization on each dimension (1=Poor, 5=Excellent):

- Our IT budget clearly connects to organizational strategic priorities: [ ]
- We balance investment across operating, capital, and projects appropriately: [ ]
- We justify IT investments in business value terms leaders understand: [ ]

- We manage budget strategically with monthly reviews and variance management: [ ]
- Stakeholders understand IT cost drivers and economics: [ ]
- We have multi-year financial forecast guiding budget planning: [ ]
- We systematically demonstrate value delivered from IT investments: [ ]

Average Score: [score]

Interpretation:

- **4.0–5.0:** Strong financial management, focus on optimization and value communication
- **3.0–3.9:** Basic practices in place, strengthen strategic budget management
- **2.0–2.9:** Significant gaps, prioritize building budget discipline and transparency
- **1.0–1.9:** Critical weaknesses, fundamental budget management improvement needed

Your Development Priorities:
Based on your assessment, what are your top 1–2 priorities for improving budget management?

Priority 1: [your answer]

Why it matters: [your answer]

Actions needed: [your answer]

Success measure: [your answer]

Priority 2: [your answer]

Why it matters: [your answer]

Actions needed: [your answer]

Success measure: [your answer]

A.3.M Module 3: Self-Assessment and Action Plan

From Module 3: Summary.

Your Module 3 Action Plan
Based on your self-assessment (next section), identify your top 3–5 priorities for strengthening strategic alignment. Use this action planning template:
Priority 1: [your answer]

Current State:

Desired State:

Key Actions:
1. [your answer]
2. [your answer]
3. [your answer]

Resources Needed:
Timeline: Start: [your answer] Key Milestones: [your answer] Complete: [your answer]

Success Measures:

Stakeholders to Engage:
Priority 2: [your answer]

Current State:

Desired State:

Key Actions:
1. [your answer]
2. [your answer]
3. [your answer]

Resources Needed:
Timeline: Start: [your answer] Key Milestones: [your answer] Complete: [your answer]

Success Measures:

Stakeholders to Engage:
Priority 3: [your answer]

Current State:

Desired State:

Key Actions:
1. [your answer]
2. [your answer]
3. [your answer]

Resources Needed:
Timeline: Start: [your answer] Key Milestones: [your answer] Complete: [your answer]

Success Measures:

Stakeholders to Engage:

90-Day Quick Wins for Strategic Alignment
While full strategic alignment takes time, you can achieve quick wins in 90 days:

Governance Quick Win (30 days): Establish basic IT Governance Working Group or Council. Don't aim for perfect, aim for functional. Schedule first meeting. Bring one real decision to make. Document and communicate decision. This demonstrates governance value immediately.

Strategic Planning Quick Win (60 days): If you don't have strategic plan, create a simple one-page version. List organizational priorities, identify how IT supports each, note 3–5 major initiatives for next year. Share with governance and get feedback. Even without a complete plan, you've started a strategic conversation.

Service Alignment Quick Win (45 days): Create basic service catalog, just top 10–15 services IT provides with simple descriptions and how to request. Publish it on intranet or shared drive. Promote it. Now you've got immediate transparency about what IT offers.

Framework Quick Win (60 days): Implement one high-value framework practice. If security is priority, do basic NIST CSF self-assessment. If service delivery is challenge, document simple incident management process. Pick one framework element, implement it well, show value.

Budget Quick Win (90 days): Create one-page budget summary showing how IT budget maps to organizational strategic goals. Share with key leadership. This demonstrates strategic thinking about budget even before next budget cycle. These quick wins build momentum and credibility for longer-term strategic alignment work.

MODULE 3 SELF-ASSESSMENT: STRATEGIC ALIGNMENT

Instructions

Rate your organization honestly on each statement using this scale:

1 = Not at all true for our organization currently

2 = Rarely true

3 = Sometimes true

4 = Often true

5 = Consistently true

Use this assessment to identify which areas of strategic alignment need the most attention. Perfect scores aren't the point. Knowing where to invest your energy is.

Section 3.1: IT Governance (5 statements)

[ ] 1. We have a functioning governance structure that makes real decisions about IT priorities

[ ] 2. Governance includes the right people from across the organization, not just IT

[ ] 3. Governance decisions are transparent and communicated to stakeholders

[ ] 4. Governance effectively balances competing priorities and resolves conflicts

[ ] 5. People trust the governance process and work through it rather than around it

Section 3.1 Score: [score] / 25

Section 3.2: Strategic Planning (5 statements)

[ ] 1. We have a current IT strategic plan that connects to organizational strategy
[ ] 2. The strategic plan guides actual resource allocation and project decisions
[ ] 3. Staff understand how their work connects to strategic priorities
[ ] 4. We review and adjust strategic direction at least annually
[ ] 5. Stakeholders outside IT see the strategic plan as credible and valuable

Section 3.2 Score: [score] / 25

Section 3.3: Frameworks and Standards (5 statements)

[ ] 1. We have adopted frameworks appropriate for our size and maturity
[ ] 2. Cybersecurity follows a recognized framework with regular assessment
[ ] 3. We have clear technology standards that guide decisions without creating rigidity
[ ] 4. Frameworks are implemented practically, not just documented
[ ] 5. Staff understand the purpose behind standards and frameworks, not just the rules

Section 3.3 Score: [score] / 25

Section 3.4: Services and Products (5 statements)

[ ] 1. We have a clear inventory of services IT provides and who owns each one
[ ] 2. Customers are involved in selecting and prioritizing technology solutions
[ ] 3. Technology lifecycle is actively managed with planned replacements
[ ] 4. Service levels are defined and communicated for our most important services
[ ] 5. We can demonstrate the value our services deliver to the organization

Section 3.4 Score: [score] / 25

Section 3.5: Budget and IT Economics (5 statements)

[ ] 1. Our IT budget explicitly connects to organizational strategic priorities
[ ] 2. Budget requests are justified in business value terms, not technical jargon
[ ] 3. We manage budget strategically with regular reviews, not just annual approval
[ ] 4. Stakeholders understand IT cost drivers and economics
[ ] 5. We systematically demonstrate value delivered from IT investments

Section 3.5 Score: [score] / 25

Total Module 3 Score: [score] / 125

Interpreting Your Scores

100–125: Strong strategic alignment. Focus on refinement and deeper integration.
75–99: Solid base with growth areas. Pick your 1–2 weakest sections for focused development.
50–74: Significant development needed. Prioritize governance and strategic planning before tackling frameworks.

Below 50: Strategic alignment needs urgent attention. Start with governance structure and stakeholder relationships.

My Top Priority Strategic Alignment Area to Develop:
Why this matters for my organization's success:
Specific actions I will take:
1. [your answer]
2. [your answer]

Month 1: [your answer] | Month 2: [your answer] | Month 3: [your answer]

A.4 Module 4 Working Documents: Delivering Great Service

A.4.1 Section 4.1: Policy Environment Self-Assessment

Policy Environment Self-Assessment

Rate your organization on each statement (1=Strongly Disagree, 5=Strongly Agree):

[ ] We have clearly established principles that guide all policy creation and review.

[ ] Our policies enable staff to serve customers effectively rather than creating obstacles.

[ ] We have clear taxonomy distinguishing policies, standards, procedures, and guidelines.

[ ] People closest to the work create policies for that work, not senior leadership creating everything.

[ ] Our policies are principle-based (what and why) rather than overly prescriptive (exactly how).

[ ] We regularly consolidate related policies rather than letting them proliferate.

[ ] We aggressively retire outdated policies rather than letting them accumulate.

[ ] Our policies align with and reinforce our cultural values rather than contradicting them.

[ ] Staff can easily find and access current policies when they need them.

[ ] We have appropriate infrastructure (content management) for policy maintenance and version control.

[ ] Policy owners are clear and accountable for keeping their policies current.

[ ] We review policies regularly (at least annually) to confirm they remain relevant and useful.

[ ] Our policies trust staff to use professional judgment rather than removing all discretion.

[ ] When mistakes occur, we resist the impulse to immediately create new policies.

[ ] Staff view policies as helpful guidance rather than bureaucratic burden.

Section 4.1 Total Score: [score] / 75

Scoring Interpretation:

- **60–75:** Strong policy environment - focus on continuous improvement and preventing backsliding
- **45–59:** Solid foundation with gaps - prioritize consolidation and moving toward principle-based approaches
- **30–44:** Significant improvement needed - start with philosophy, taxonomy, and aggressive cleanup
- **Below 30:** Policy environment is likely obstacle to service - fundamental transformation required

Your Development Priorities:

Based on your assessment, what are your top 2–3 priorities for improving your policy environment?

Priority 1: [your answer]

Why it matters: [your answer]

First steps: [your answer]

Success measure: [your answer]

Timeline: [your answer]

Priority 2: [your answer]

Why it matters: [your answer]

First steps: [your answer]

Success measure: [your answer]

Timeline: [your answer]

Priority 3: [your answer]

Why it matters: [your answer]

First steps: [your answer]

Success measure: [your answer]

Timeline: [your answer]

A.4.2 Section 4.2: Portfolio and Service Management Self-Assessment

Portfolio and Service Management Self-Assessment
Rate your organization on each statement (1=Strongly Disagree, 5=Strongly Agree):
[ ] We manage services, applications, infrastructure, and projects as one connected portfolio, not as separate lists.
[ ] I could confidently list our top 20 services to elected officials, including the value and cost of each.
[ ] Every service in our portfolio has a clearly identified owner who feels personally accountable for it.
[ ] We have a published service catalog that customers can use to understand what IT provides and at what level.
[ ] Our staff view themselves as owners of their services, not as reactive responders to whatever comes in.
[ ] When a department requests a new system or service, we have a transparent, defendable process for deciding what gets done.

[ ] We make deliberate, documented decisions about which services to support and at what service level.
[ ] We routinely retire outdated systems and consolidate redundant ones rather than letting them accumulate.
[ ] Our portfolio decisions are visible to customers and partners so they understand trade-offs.
[ ] Service-level expectations are documented, communicated, and tracked.
[ ] We can clearly explain what would be affected and what the community impact would be if budget cuts were required.
[ ] When new technology requests come in, our intake and triage process gets them to the right path quickly.
[ ] Our project portfolio is balanced between operational maintenance, modernization, and new investment.
[ ] Service performance is reported regularly, both to leadership and to the customers who depend on each service.
[ ] I can describe the value our top 5 services deliver to citizens, not just what they do technically.
Section 4.2 Total Score: [score] / 75

Scoring Interpretation:
60–75: Strong portfolio and service management discipline. Focus on continuous refinement and stronger linkage to budget and governance.
45–59: Solid foundation with gaps. Likely missing service catalog discipline or ownership culture. Prioritize visibility and accountability.
30–44: Significant work needed. Likely managing as a list of separate items rather than a connected portfolio. Start with naming services and assigning owners.
Below 30: Portfolio management is more reactive than strategic. Fundamental work required on what you support and how you decide.

Your Development Priorities:
Based on your assessment, what are your top 2–3 priorities for improving this area?
Priority 1: [your answer]
Why it matters: [your answer]
First steps: [your answer]
Success measure: [your answer]
Timeline: [your answer]

Why it matters: [your answer]
First steps: [your answer]
Success measure: [your answer]
Timeline: [your answer]

A.4.3 Section 4.3: Knowledge and Domain Management Self-Assessment

Knowledge and Domain Management Self-Assessment
Rate your organization on each statement (1=Strongly Disagree, 5=Strongly Agree):
[ ] Critical operational knowledge is documented and accessible, not living only in people's heads.
[ ] If our most knowledgeable system expert left tomorrow, we could continue normal operations without crippling delay.
[ ] Every critical system and service has a clearly identified primary owner and at least one knowledge shadow.
[ ] A new team member can find the documentation they need to understand a system without having to ask someone.
[ ] Our shared drives, knowledge bases, and documentation repositories are organized with consistent practices.
[ ] We have clear domain boundaries that define which team owns which systems, services, and business areas.
[ ] Domain ownership is clear enough that customers and partners know exactly who to engage for a given need.
[ ] Cross-domain work has documented work protocols, escalation paths, and shared responsibility expectations.
[ ] Our domain boundaries enable collaboration rather than creating territorial silos.
[ ] Knowledge transfer is a built-in part of how we manage talent and plan for succession.
[ ] When someone gives notice, we begin structured knowledge transfer immediately, not as an afterthought.
[ ] Staff are willing and motivated to share knowledge across domain boundaries.
[ ] Our documentation gets maintained over time, not abandoned after initial creation.
[ ] We distinguish data, information, and knowledge, and we manage all three deliberately.
[ ] Knowledge management is a leadership priority, not something that "happens when there is time."
Section 4.3 Total Score: [score] / 75

Scoring Interpretation:

60–75: Strong knowledge and domain management. Focus on sustaining the discipline as the organization grows and evolves.
45–59: Solid foundation with gaps. Likely strong in some domains and weak in others. Identify the highest-risk single points of failure first.
30–44: Significant work needed. Likely depending on individual heroics and tribal knowledge. Start with the most business-critical systems.
Below 30: Knowledge is fragile and ownership is unclear. One key departure could create a serious operational crisis. Treat this as urgent.

Your Development Priorities:
Based on your assessment, what are your top 2–3 priorities for improving this area?
Priority 1: [your answer]
Why it matters: [your answer]
First steps: [your answer]
Success measure: [your answer]

Priority 3: [your answer]
Why it matters: [your answer]
First steps: [your answer]
Success measure: [your answer]
Timeline: [your answer]

A.4.4 Section 4.4: Customer Service Self-Assessment

Customer Service Self-Assessment
Rate your organization on each statement (1=Strongly Disagree, 5=Strongly Agree):
[ ] IT staff view customer service as their primary purpose, not as an interruption to "real" technical work.
[ ] Staff are engaged and proud of the services they deliver, not just going through the motions.
[ ] When customers contact us with problems, they feel helped rather than tolerated.
[ ] Front-line staff are empowered to resolve common issues without managerial approval.
[ ] We use principles and judgment rather than rigid scripts to guide customer interactions.
[ ] When staff use their authority to help customers, they get recognition rather than consequences.

[ ] We measure 3–5 core customer service metrics and act on what they show.
[ ] Customers have easy, well-known channels to provide feedback on service quality.
[ ] When staff make mistakes, the response is "how do we prevent this" rather than "who do we blame."
[ ] Service excellence is treated as part of performance reviews and advancement criteria.
[ ] Process design supports common cases well rather than being optimized for rare edge cases.
[ ] Senior leadership models the service behavior they expect from staff.
[ ] We can name specific examples of staff going above and beyond for customers in the past month.
[ ] The barriers that prevent staff from delivering excellent service have been identified and are being addressed.
[ ] Customers describe IT as helpful and responsive, not as an obstacle to getting their work done.
Section 4.4 Total Score: [score] / 75

Scoring Interpretation:
60–75: Strong customer service culture. Customer service is self-sustaining rather than driven by special initiatives. Focus on sustaining as you grow.
45–59: Solid culture in places, weaker in others. Often a mix of strong individual performers and inconsistent systems. Prioritize what gets measured and recognized.
30–44: Service is a stated value but not lived consistently. Likely script-driven rather than principle-driven. Start with empowerment and barrier removal.
Below 30: Service culture issues are likely affecting your organization's view of IT. Treat as a primary leadership priority. Begin with how you treat your own staff.

Your Development Priorities:
Based on your assessment, what are your top 2–3 priorities for improving this area?
Priority 1: [your answer]
Why it matters: [your answer]
First steps: [your answer]
Success measure: [your answer]
Timeline: [your answer]
Priority 2: [your answer]

Why it matters: [your answer]

First steps: [your answer]
Success measure: [your answer]
Timeline: [your answer]

A.4.5 Section 4.5: Business Relationship Management Self-Assessment

Business Relationship Management Self-Assessment
Rate your organization on each statement (1=Strongly Disagree, 5=Strongly Agree):
[ ] Business leaders involve IT at the beginning of major initiatives, not the middle or the end.
[ ] Department heads see me and my team as peers and advisors, not as service providers fulfilling requests.
[ ] When budget discussions happen, business leaders advocate for IT investment, not just me.
[ ] I can describe the top three strategic priorities for each of our major departments.
[ ] IT has been invited to strategic planning sessions in the past year.
[ ] Business relationship management is a team capability, not just a CIO responsibility.
[ ] My staff speak the business language of the departments they support, not just IT language.
[ ] We are honest with partners about constraints and trade-offs, not over-promising to be liked.
[ ] Relationships operate within governance, not around it. Informal deals are rare.
[ ] When business leaders talk about IT in our absence, what they say strengthens IT's standing.
[ ] We have actively invested in our most skeptical and critical partners, and at least some have become advocates.
[ ] Department heads ask IT's opinion on issues that are not explicitly IT-related.
[ ] We can name specific examples in the past year where IT contributed to business strategy, not just delivery.
[ ] We measure relationship outcomes (advocacy, partnership engagement) rather than just relationship activities (meetings attended).
[ ] IT is credited by business leaders for enabling business success, not just "keeping systems running."
Section 4.5 Total Score: [score] / 75

Scoring Interpretation:
60–75: Strong strategic partnership. IT is woven into business strategy and trusted as a peer. Focus on sustaining and developing the bench.
45–59: Mixed maturity. Strong with some departments, weaker with others. Identify which relationships need the most investment and start there.

30–44: Mostly transactional. You are likely seen as competent service providers but not strategic partners. Begin shifting how you engage on new initiatives.
Below 30: IT is in order-taker mode. Business leaders are not consulting IT strategically. This is a leadership priority. Section 4.5's approach is essential.

Your Development Priorities:
Based on your assessment, what are your top 2–3 priorities for improving this area?
Priority 1: [your answer]
Why it matters: [your answer]
First steps: [your answer]

A.4.M Module 4: Self-Assessment, Action Plan, and Quarterly Measurement Templates

From Module 4: Summary.

MODULE 4 SELF-ASSESSMENT: SERVICE DELIVERY

Instructions
Rate your organization honestly on each statement using this scale:

- 1 = Not at all true for our organization currently
- 2 = Rarely true
- 3 = Sometimes true
- 4 = Often true
- 5 = Consistently true

Section 4.1: Policies and Procedures (5 statements)
[ ] 1. Our policies enable staff to serve customers effectively rather than creating obstacles

[ ] 2. We have a clear taxonomy distinguishing policies, standards, procedures, and guidelines

[ ] 3. Our policies are principle-based rather than overly prescriptive

[ ] 4. We regularly retire outdated policies rather than letting them accumulate

[ ] 5. Staff view policies as helpful guidance rather than bureaucratic burden

Section 4.1 Score: [score] / 25

Section 4.2: Portfolio and Service Management (5 statements)

[ ] 1. We have a clear inventory of all services IT provides with defined owners

[ ] 2. We make deliberate decisions about what to start, stop, and continue based on strategic value

[ ] 3. Service definitions are documented and communicated to customers

[ ] 4. We actively manage our application portfolio with lifecycle planning

[ ] 5. Customers know what services are available and how to request them

Section 4.2 Score: [score] / 25

Section 4.3: Knowledge and Domain Management (5 statements)

[ ] 1. Critical operational knowledge is documented and accessible, not dependent on individual memory

[ ] 2. Staff can resolve common issues without constant escalation

[ ] 3. Domain boundaries between IT functional areas are clear with defined coordination protocols

[ ] 4. We have a functioning knowledge base that staff use

[ ] 5. New staff can become productive within a reasonable timeframe because knowledge is documented

Section 4.3 Score: [score] / 25

Section 4.4: Customer Service (5 statements)

[ ] 1. Customers rate IT service quality favorably overall

[ ] 2. Staff view customer service as their primary purpose, not an interruption

[ ] 3. We regularly measure customer satisfaction and act on the results

[ ] 4. Staff are trusted and equipped to make good decisions for customers without excessive escalation

[ ] 5. Our service culture emerged from employee engagement, not mandates

Section 4.4 Score: [score] / 25

Section 4.5: Business Relationship Management (5 statements)

[ ] 1. Department heads view IT as a strategic partner rather than an order-taker

[ ] 2. IT is invited to strategic conversations early rather than after decisions are made

[ ] 3. We have regular, structured engagement with key business partners beyond project-specific interactions

[ ] 4. Business partners bring ideas and challenges to IT on their own

[ ] 5. IT understands the mission priorities of the departments it serves

Section 4.5 Score: [score] / 25

Total Module 4 Score: [score] / 125

Interpreting Your Scores

- 100–125: Strong service delivery capability. Focus on long-term viability and continuous refinement.
- 75–99: Solid base with gaps. Identify your weakest section and address root causes.
- 50–74: Significant improvement needed. Ensure Modules 2 and 3 are in place before investing heavily here.
- Below 50: Service delivery fundamentals need attention. Start with policy simplification and service inventory before tackling culture change.

Your 90-Day Action Plan

Based on your work in Module 4, create a focused action plan:

Month 1: Assess and Prioritize

Week 1–2: Complete Module 4 Self-Assessment

- Evaluate current state across all five sections
- Identify your weakest areas
- Determine root causes of service gaps

Week 3–4: Engage Stakeholders

- Gather feedback from 5–10 key business stakeholders about IT service quality
- Identify their top 3 service priorities
- Understand where their perceptions differ from yours

Month 2: Quick Wins and Foundation

Select 1–2 quick wins that will demonstrate commitment and build momentum:

If policies are your issue (4.1):

- Identify 3 policies that most frustrate customers

- Simplify or eliminate at least one
- Communicate the change and rationale

If portfolio clarity is your issue (4.2):

- Create simple one-page service catalog
- Assign clear owners to top 10 services
- Communicate ownership broadly

If knowledge is your issue (4.3):

- Identify top 10 recurring issues
- Create simple documentation for each
- Make documentation easily accessible

If customer service is your issue (4.4):

- Implement post-interaction CSAT surveys
- Review results monthly with team
- Act on feedback visibly

If business relationships are your issue (4.5):

- Schedule quarterly business reviews with top 3 departments
- Conduct first round focusing on listening
- Identify one strategic opportunity from each conversation

Month 3: Build Sustainable Practices

Establish ongoing practices that sustain improvement:

Communication:

- Create monthly IT service update (one page, focused on business value)
- Establish regular touchpoints with key stakeholders
- Share service metrics transparently

Team Development:

- Conduct team discussion on service excellence
- Identify capability gaps
- Create development plan

Measurement:

- Select 3–5 core service metrics to track
- Establish baseline
- Create simple dashboard

Governance:

- Add service quality discussion to regular governance meetings
- Review stakeholder feedback with governance body

- Make service excellence explicit governance priority

Implementation Priorities by Organizational Context

Your priorities should align with your current situation:

If you're a new CIO:

- **Start with:** Business Relationship Management (4.5) to build relationships and understand needs
- **Then focus on:** Customer Service (4.4) to demonstrate commitment to service
- **Later address:** Portfolio Management (4.2) and Knowledge Management (4.3) once you have foundation

If service quality is poor:

- **Start with:** Customer Service (4.4) and Policies (4.1) to remove barriers and enable staff
- **Then focus on:** Knowledge Management (4.3) to give staff tools to succeed
- **Later address:** Portfolio Management (4.2) and BRM (4.5) once basic service improves

If you're seen as order-taker:

- **Start with:** Business Relationship Management (4.5) to shift perceptions
- **Then focus on:** Portfolio Management (4.2) to demonstrate strategic thinking
- **Later address:** Customer Service (4.4) and Knowledge (4.3) to deliver on strategic positioning

If governance isn't working:

- **Start with:** Business Relationship Management (4.5) to build relationships that make governance functional
- **Then focus on:** Portfolio Management (4.2) to give governance real content
- **Later address:** Customer Service (4.4) and Policies (4.1) once governance is working

If staff are disengaged:

- **Start with:** Knowledge Management (4.3) and clear ownership to give staff autonomy
- **Then focus on:** Policies (4.1) to remove barriers and enable decisions
- **Later address:** Customer Service (4.4) once engagement improves

Measuring Your Progress

Track improvement across Module 4 using these indicators:

Stakeholder Perspective (Quarterly Survey):

- IT is involved in business planning early
- IT understands our business needs
- IT delivers solutions that work well for us
- We trust IT to help us achieve our goals
- IT is responsive when we need help

Employee Perspective (Quarterly Pulse):

- I understand how my work supports organizational mission
- I have authority to make customer-focused decisions
- I have the knowledge and tools I need to serve customers well
- I feel pride in the quality of service we provide
- Leadership removes barriers that prevent good service

Operational Metrics (Monthly Tracking):

- Customer Satisfaction Score (CSAT) trend
- First Contact Resolution (FCR) rate
- Customer Effort Score (CES)
- Service portfolio clarity (% services with clear owners and definitions)
- Knowledge base usage and effectiveness

Relationship Quality (Quarterly Assessment):

- Number of strategic planning sessions where IT is invited
- Frequency of unprompted stakeholder outreach by IT
- Balance of emergency vs. planned requests
- Business unit advocacy for IT budget/resources

Set baseline measurements now. Track quarterly. Celebrate improvements. Investigate declines.

Before Moving to Module 5

Before proceeding to Module 5: Continuously Improving, verify you have:

Completed the Module 4 Self-Assessment honestly, identifying specific gaps in policies, portfolio management, knowledge management, customer service, and business relationships

Gathered business feedback on IT service quality to understand their perspective, not just your internal assessment

Identified your top 1–2 service priorities based on assessment and stakeholder input

Created your 90-day action plan with specific actions, owners, and success measures

Shared your plan with your leadership team and key partners to build commitment and accountability

Implemented at least one quick win that demonstrates commitment to service excellence and builds momentum

Established baseline metrics so you can track improvement over time

Secured partner commitment to partner with you on service excellence journey

A.5 Module 5 Working Documents: Continuously Improving

A.5.1 Section 5.1: 90-Day Feedback and Engagement Action Plan

Your 90-Day Feedback and Engagement Action Plan
Use this template to plan your initial work on feedback and engagement:

Current State Assessment:
Where are we today with feedback culture? (Be brutally honest)
What are the biggest barriers to effective feedback right now?
What's one area where staff feedback could immediately improve operations?

Quick Wins (Month 1):
One formal feedback channel we can establish or improve this month:
One meeting where we'll add a standing "improvements" agenda item:
One recent suggestion we can act on quickly to demonstrate responsiveness:

Building groundwork (Month 2):
How we'll close the loop on existing feedback:
Process we'll implement for evaluating improvement suggestions:
Training or discussion we'll do on psychological safety:

Scaling Up (Month 3):
How we'll implement the 20% principle (even if starting with 5–10%):
Engagement measurement we'll establish (pulse survey, check-ins, etc.):
Way we'll make improvement work visible and celebrate progress:

Success Measures:
In 90 days, I'll know this is working if:
1. [your answer]
2. [your answer]
3. [your answer]

A.5.2 Section 5.2: 90-Day Integration Action Plan

Your 90-Day Integration Action Plan
Use this template to plan your initial integration work:

Current State Assessment:
Three most problematic separate IT processes right now:
1. [your answer]
2. [your answer]
3. [your answer]
Enterprise processes/structures these could integrate with:
1. [your answer]

2. [your answer]
3. [your answer]

Quick Win (Month 1):
First integration opportunity (low effort, high impact):
Existing organizational structure/process to build on:
Stakeholders to engage:
First step this week:

Building Momentum (Month 2):
Second integration opportunity:
What this integration will eliminate or simplify:
Partnerships to establish (HR, Procurement, Risk, Facilities, etc.):
How to measure success:

Scaling Up (Month 3):
Third integration opportunity (may be higher effort):
Resources or changes needed:
Timeline for full implementation:
How this positions future integrations:

Success Measures:
In 90 days, I'll know integration is working if:
1.
(Example: Reduction in technology items reaching Board without IT review)
2.
(Example: Increased attendance/engagement in forums where IT is integrated vs. separate IT meetings)
3.
(Example: Fewer instances of shadow IT or process workarounds)

Communication Plan:
How I'll explain integration benefits to:

- IT staff who may worry about losing control:
- Business partners who may see IT as inserting itself:
- Executive leadership who approved separate IT structures:

A.5.3 Section 5.3: 90-Day Making Things Better Action Plan

Your 90-Day Making Things Better Action Plan
Use this template to plan your initial work building a deliberate improvement environment.

Current State Assessment:

If you asked your staff today whether improvement work is "real work" or something they do on their own time, what would they say? [your answer]
What is the most recent improvement someone on your team proposed, and what happened to it? [your answer]
What three obstacles consistently prevent improvement initiatives from succeeding in your organization?
1. [your answer]
2. [your answer]
3. [your answer]
What percent of your team's capacity is currently protected for improvement work?
[ ] percent
What you wish that number was:
[ ] percent

Quick Wins (Month 1):
The first obstacle from the assessment above that you will remove this month: [your answer]
The first improvement someone has already proposed that you will commit to acting on, visibly: [your answer]
The simple intake process you will establish so any staff member knows how to propose an improvement: [your answer]
How you will communicate to your team that improvement work counts as real work: [your answer]

Building Momentum (Month 2):
The protected improvement time you will establish (target: 20 percent, start with 10 percent if needed): [your answer]
The decision-rights framework you will publish, so people know what they can improve on their own authority versus what requires approval: [your answer]
The intake-evaluation-prioritization process you will put in place (keep it simple, one page): [your answer]
Two more obstacles you will remove this month:
1. [your answer]
2. [your answer]

Scaling Up (Month 3):
How you will integrate improvement work into existing meeting rhythms (operations review, leadership team, all-staff): [your answer]
How you will track improvement initiatives to completion, not just initiation (links to Section 5.4 work): [your answer]
How you will make completed improvements visible and celebrated: [your answer]
How you will sustain leadership commitment when operational pressure increases: [your answer]

Success Measures:
In 90 days, I will know this is working if:
1.
(Example: At least three improvements proposed by staff have been implemented and visible)
2.
(Example: Staff describe improvement work as part of their job, not extra)
3.
(Example: At least one structural obstacle that had blocked prior improvement work has been removed)
The Improvements I Will Personally Sponsor:
The first improvement I will sponsor personally (not delegate) to show that this work matters: [your answer]
The change I will make to my own leadership practice based on what improvement work reveals: [your answer]

A.5.4 Section 5.4: 90-Day Performance Management Implementation Plan

90-Day Action Plan Template
Getting started with performance management for continuous improvement:

Month 1: Foundation and Planning

Week 1–2:

- Conduct leadership team workshop on organizational maturity goals
- Review vision, values, and strategic priorities from Modules 2–3
- Identify 3–5 organizational maturity objectives for the year
- Draft key results for each objective
- Begin performance management system research/selection

Week 3–4:

- Finalize organizational objectives with leadership team consensus
- Select performance management system (or commit to simple interim approach)
- Create implementation plan and timeline
- Each leadership team member drafts their own goals aligned to org objectives
- Schedule monthly 1:1s between CIO and direct reports

Month 2: Leadership Team Implementation

Week 5–6:

- Leadership team goals finalized and entered in PM system
- First round of 1:1 meetings completed with goal discussions
- System configuration and training for leadership team
- Begin tracking progress and obstacles
- Identify early wins to demonstrate value

Week 7–8:

- Leadership team conducting second round of 1:1s
- Review organizational goal progress at leadership team meeting
- Develop manager training plan for Phase 2 rollout
- Address obstacles and system issues identified in pilot
- Communicate to broader organization about PM initiative and timeline

Month 3: Manager Preparation and Broader Planning

Week 9–10:

- Manager training sessions on PM philosophy, goal-setting, conducting 1:1s
- Managers begin drafting team objectives that support organizational goals
- System training for all managers
- Communication to all staff about upcoming rollout

Week 11–12:

- Team objectives finalized with manager and leadership review
- Managers schedule monthly 1:1s with all direct reports
- Plan all-employee training and goal-setting sessions for Month 4
- Celebrate and communicate Phase 1 successes and learnings
- Prepare for Phase 2 expansion

Success Indicators (90 Days):

- Organizational maturity objectives established with measurable key results
- All leadership team members have documented goals in PM system
- 95%+ 1:1 completion rate for leadership team
- PM system selected and operational for leadership team
- Manager training completed
- Team objectives drafted for all teams
- Communication plan executed for broader rollout
- At least 2–3 early wins (completed goals) to demonstrate value
- Leadership team confidence in approach based on pilot experience

A.5.5 Section 5.5: 90-Day Innovation Leadership Implementation Plan

90-Day Action Plan Template

Getting started with systematic innovation leadership:

Month 1: Assessment and Foundation

Week 1–2:

- Assess current innovation state: What innovations happening? Where? By whom?
- Identify innovation barriers: What prevents people from innovating?
- Review past innovation attempts: What succeeded? What failed? What was learned?
- Assess innovation culture: Do people feel safe experimenting?

Week 3–4:

- Communicate innovation expectations: Innovation is everyone's responsibility
- Establish innovation as legitimate work within 20% improvement time
- Create simple innovation intake process (can use existing improvement intake from Section 5.3)
- Identify 2–3 small innovation opportunities people can pursue immediately

Month 2: Building Momentum

Week 5–6:

- Launch first small innovations with visible leadership support
- Conduct innovation discussion in leadership team meeting
- Identify 1–2 departmental innovation partnership opportunities through BRM
- Establish innovation evaluation criteria and governance levels
- Begin tracking innovation initiatives in performance management system

Week 7–8:

- Review progress on initial innovations in 1:1 meetings
- Share early learning (successful or not) in team meetings
- Initiate first departmental innovation partnership pilot
- Allocate innovation budget if not already established
- Celebrate innovation attempts publicly

Month 3: Sustainability and Scale

Week 9–10:

- Conduct innovation retrospective with leadership team
- Assess which innovations are ready to scale to production
- Document and share innovation lessons learned
- Refine innovation framework based on learning
- Identify next wave of innovation opportunities

Week 11–12:

- Include innovation in next governance meeting as standing agenda
- Incorporate innovation expectations into upcoming performance review discussions
- Plan innovation showcase for end of quarter
- Establish innovation metrics for ongoing tracking
- Communicate innovation wins to stakeholders

Success Indicators (90 Days):

- At least 5 small innovations in pilot phase across different areas of IT
- At least 1 departmental innovation partnership initiated
- Innovation discussed regularly in team meetings and 1:1s
- Innovation initiatives tracked in performance management system
- Innovation included in governance as standing topic
- At least one innovation "failure" openly discussed for learning value
- Staff can articulate that innovation is expected, not just permitted
- Stakeholders see IT as innovation partner, not obstacle

A.5.M Module 5: Self-Assessment and Action Plan

From Module 5: Summary.

Your Module 5 Action Plan

Where should you focus first? Use this framework to prioritize:

Priority 1: Cultural Foundation (Section 5.1)

- **Why it matters:** Without culture valuing improvement, nothing else works
- **Actions needed:** Assess current feedback culture, establish feedback channels, protect initial improvement time (even 5–10%), build psychological safety
- **Success measure:** People propose improvements without fear, feedback leads to visible action

Priority 2: Leadership Framework (Section 5.3)

- **Why it matters:** Provides practical mechanisms translating culture into action

- **Actions needed:** Create improvement intake process, establish evaluation criteria, define decision rights, remove initial obstacles
- **Success measure:** Improvement ideas flow in regularly, decisions happen within weeks not months

Priority 3: Quick Wins (All Sections)

- **Why it matters:** Demonstrates improvement value, builds momentum, earns credibility
- **Actions needed:** Identify 3–5 high-impact/low-effort improvements, protect time to complete them, communicate results widely
- **Success measure:** Visible improvements completed within 90 days

Priority 4: Performance Management Integration (Section 5.4)

- **Why it matters:** Creates accountability so improvement happens consistently
- **Actions needed:** Include improvement goals in performance discussions, track initiatives to completion, celebrate improvement work
- **Success measure:** Improvement work tracked systematically, completion rates high

Priority 5: Innovation Capability (Section 5.5)

- **Why it matters:** Enables breakthrough change alongside incremental improvement
- **Actions needed:** Apply innovation frameworks to strategic opportunities, protect innovation time, learn from failures
- **Success measure:** Both incremental and breakthrough improvements happening

90-Day Action Plan for Continuous Improvement

Month 1: Establish Foundation

Week 1–2:

- Review current state. Do people believe improvement work is valued? Do they know what authority they have?
- Assess feedback culture honestly

Week 3–4:

- Create simple improvement intake mechanism (form, email, regular discussion time)
- Communicate that improvement work is real work
- Share decision rights framework

Month 2: Build Momentum

Week 5–6:

- Identify 3–5 "quick win" improvements (high impact, low effort, high visibility)
- Assign ownership explicitly
- Protect time for quick win work

Week 7–8:

- Hold improvement discussions in team meetings to surface opportunities
- Apply evaluation criteria to new ideas
- Begin tracking initiatives
- Complete and communicate first small wins

Month 3: Reinforce and Scale

Week 9–10:

- Conduct first improvement retrospective
- Integrate improvement discussions into regular 1:1s
- Begin protecting 10–15% time for improvement

Week 11–12:

- Celebrate improvements completed
- Share lessons learned
- Adjust processes based on experience
- Plan next improvement cycle

MODULE 5 SELF-ASSESSMENT: CONTINUOUS IMPROVEMENT

Instructions

Rate your organization honestly on each statement using this scale:

1 = Not at all true for our organization currently

2 = Rarely true

3 = Sometimes true

4 = Often true

5 = Consistently true

This assessment helps you figure out where to focus your continuous improvement work. The goal isn't scoring 5 on everything. It's knowing where to focus.

Section 5.1: Feedback and Engagement (5 statements)

[ ] 1. We have structured mechanisms for gathering feedback from staff and stakeholders

[ ] 2. Feedback leads to visible action; people see their input make a difference

[ ] 3. Employee engagement is measured regularly and results are acted on

[ ] 4. People feel comfortable raising concerns and suggesting improvements

[ ] 5. Staff time is explicitly protected for improvement work

Section 5.1 Score: [score] / 25

Section 5.2: Organizational Integration (5 statements)

[ ] 1. IT processes are embedded into organizational workflows, not operating in isolation

[ ] 2. Other departments include IT in their planning and decision-making

[ ] 3. IT governance requirements are integrated into organizational processes

[ ] 4. Cross-functional relationships facilitate coordination rather than creating friction

[ ] 5. IT is seen as an organizational partner, not a separate support function

Section 5.2 Score: [score] / 25

Section 5.3: Making Things Better (5 statements)

[ ] 1. We have a systematic process for identifying and prioritizing improvements

[ ] 2. Improvement initiatives are resourced and tracked to completion

[ ] 3. Leadership actively creates conditions for improvement, not just expecting it

[ ] 4. Authority matches accountability for improvement work

[ ] 5. We regularly complete improvement initiatives rather than starting and abandoning them

Section 5.3 Score: [score] / 25

Section 5.4: Performance Management (5 statements)

[ ] 1. Performance management focuses on development and improvement, not just evaluation

[ ] 2. Regular 1:1 meetings happen between managers and staff at least monthly

[ ] 3. Improvement goals are included in individual performance objectives

[ ] 4. We celebrate improvement attempts and learning, not just successful outcomes

[ ] 5. Performance management drives behavior toward continuous improvement

Section 5.4 Score: [score] / 25

Section 5.5: Innovation Leadership (5 statements)

[ ] 1. Innovation is everyone's responsibility, not just special teams

[ ] 2. We distinguish between incremental improvement and breakthrough innovation

[ ] 3. Innovation initiatives go through systematic intake and evaluation

[ ] 4. We learn from innovation failures as much as from successes

[ ] 5. Successful innovations are scaled to production, not just piloted

Section 5.5 Score: [score] / 25

Total Module 5 Score: [score] / 125

Interpreting Your Scores

100–125: Excellent continuous improvement capability. Focus on sustaining momentum and mentoring others.

75–99: Solid foundation with room for growth. Pick your 1–2 weakest sections for focused development.

50–74: Developing capability with significant gaps. Prioritize feedback culture and improvement processes.

Below 50: Limited continuous improvement capability. Begin with cultural groundwork (Section 5.1) before other sections.

My Top Priority Continuous Improvement Area to Develop:

Why this matters for my organization's success:

Specific actions I will take:

1. [your answer]

2. [your answer]

3. [your answer]

Resources I need:

How I will measure progress:

Accountability mechanism:

Monthly check-in dates:

Month 1: [your answer] | Month 2: [your answer] | Month 3: [your answer]

GLOSSARY OF KEY TERMS

High-Performing Government IT (HPG-IT) Framework

This glossary defines the key terms, concepts, frameworks, and acronyms used throughout the HPG-IT manuscript. Terms are organized alphabetically within thematic groupings for ease of reference. Where a term is introduced in a specific section, that section is noted.

Leadership and Personal Effectiveness

360-Degree Feedback A structured process for gathering performance and behavioral feedback from multiple sources, including peers, direct reports, and supervisors, rather than only from the person's direct manager. A recommended tool in Section 1.3 for building accurate self-awareness and identifying leadership development priorities.

Alignment vs. Agreement A critical distinction introduced in Section 2.1. Agreement means everyone concurs with a decision. Alignment means everyone commits to supporting and executing a decision even if they personally would have chosen differently. High-performing leadership teams operate on alignment, not unanimity. Once a decision is made, every team member is expected to align and execute.

Authority = Accountability Principle The governance principle that those who make decisions must own the outcomes, and those who are accountable for outcomes must have the authority to act. When authority and accountability are mismatched, good governance breaks down. Introduced in Section 3.1 and reinforced throughout Modules 3 and 4.

MBWA (Management by Walking Around) A leadership practice where the CIO and managers engage staff directly by being physically present and accessible in the workplace rather than managing only through formal meetings and reports. Introduced in Section 1.2 as one of the core activities deserving leadership time investment.

Political Capital The accumulated trust, credibility, and relationship currency that enables a CIO to exercise influence, push difficult initiatives, and make decisions that may not be universally popular. Political capital is earned through demonstrated competence, reliability, and integrity over time. It is spent when you push a controversial initiative, say no to a powerful executive, or make decisions that benefit the enterprise at the cost of one department. New CIOs should spend their first year building capital before pushing major change agendas. Introduced in Section 1.4.

Political Intelligence The ability to read organizational dynamics, understand informal power structures, anticipate how decisions will land politically, and manage

competing interests without losing integrity. A core competency for government IT leaders described in Section 1.4.

The Purity Trap A leadership failure pattern where an IT leader becomes so focused on technical correctness, best practices, and standards compliance that they begin treating the organization and its people as obstacles rather than those they serve. The purity trap manifests as chronic frustration with users, executives, and budget constraints rather than creative problem-solving within real-world limitations. Introduced in Section 1.1.

Role Overload A condition where the sheer volume of competing demands, both strategic and operational, exceeds the available time and energy of the CIO or IT leader. A recognized risk for local government IT leaders managing both day-to-day operations and long-term organizational development. Noted in Section 1.2.

Self-Awareness The ability to accurately understand one's own strengths, weaknesses, blind spots, values, and impact on others. Described in Section 1.3 as the foundational competency for all other leadership development. The HPG-IT approach emphasizes building self-awareness through honest self-reflection, external perspective (360-degree feedback), and identifying patterns over time.

Technology Delivery Expert The redefined identity of the CIO role. Being a CIO is not primarily about technical expertise in systems, infrastructure, or architecture. It is about expertly delivering technology value to the organization through leadership, governance, service management, strategic alignment, and relationship-building. This distinction is foundational to the entire HPG-IT Framework. Introduced in the Foreword.

"Working In" vs. "Working On" the Business A fundamental distinction between operational activity (handling day-to-day technical tasks, solving immediate problems) and strategic leadership activity (building organizational capability, culture, and systems for the long-term). High-performing CIOs protect time to work on the business even when operational pressure pushes toward working only in it. Introduced in Section 1.2.

Organizational Health

Culture (Organizational) The collection of shared assumptions, beliefs, values, behaviors, and practices that define how an organization operates, as distinct from how it says it operates. Culture is described in Section 2.5 as something leaders create whether they intend to or not, through what they model, tolerate, reward, and address. The HPG-IT approach distinguishes between stated values (what's written down) and lived values (what shapes behavior).

Domain Management The operational practice of defining clear boundaries, coordination protocols, and escalation paths between IT functional areas so that cross-boundary work flows smoothly without organizational friction, duplication, or territorial conflict. Domain management translates organizational structure into day-to-day operational clarity. Introduced in Section 4.3.

Individual Development Plan (IDP) A structured document that captures an employee's development goals, skill gaps, desired growth trajectory, and specific actions for professional development. IDPs are a core tool of Section 2.4's capability development approach.

Knowledge Management The practice of systematically capturing, organizing, and making accessible critical operational knowledge so that it is not dependent on any individual's memory or continued employment. In the IT context, knowledge management reduces single points of failure, speeds problem resolution, and supports service continuity. Introduced in Section 4.3.

Organizational Health The combined state of a team's leadership effectiveness, shared purpose, structural clarity, people capabilities, cultural environment, and communication practices. The HPG-IT Framework treats organizational health as the prerequisite for strategic effectiveness and service excellence. Module 2 is dedicated to building it.

Psychological Safety A team climate in which individuals feel safe to speak up, raise concerns, admit mistakes, ask questions, and challenge assumptions without fear of punishment or humiliation. Google's Project Aristotle project, cited in Section 2.5, identified psychological safety as the single most important factor in high-performing teams. The HPG-IT Framework treats it as foundational to learning culture and continuous improvement.

RACI Matrix A decision-accountability tool that defines for any given process or initiative who is Responsible (does the work), Accountable (owns the outcome, only one person), Consulted (provides input), and Informed (needs to know). Recommended in Section 2.3 for major cross-functional processes where clarity of ownership is critical.

Service Ownership The assignment of specific individuals to own defined IT services, meaning they are accountable for service quality, customer satisfaction, documentation, and continuous improvement of that service. Service ownership is a cultural and structural practice introduced in Section 4.2 that shifts IT from reactive task-handling to anticipatory service stewardship.

Span of Control The number of people who report directly to a manager. The HPG-IT Framework offers practical norms for local government IT: 4–7 direct reports for a CIO, 5–12 for managers depending on work complexity, and 5–15 for front-line leads and supervisors. Span of control that is too wide leads to management overload; too narrow leads to unnecessary bureaucracy. Introduced in Section 2.3.

Succession Planning The early identification and development of potential successors for critical roles before those roles become vacant. Succession planning reduces organizational vulnerability to staff departures and builds bench strength. Described in Section 2.4 as an essential leadership responsibility, not a reactive process.

Vision, Mission, Purpose, and Values The four foundational elements of organizational identity addressed in Section 2.2. Mission defines what the

organization does. Values define how it operates. Purpose defines why the work matters beyond the obvious. Vision defines what the organization is working to become. The HPG-IT Framework emphasizes that most IT departments have mission and values in place but lack real clarity on purpose and vision.

Strategy and Governance

Alignment Gap The systemic gap between what IT provides and what customers need. The alignment gap results from IT selecting technology and services based on internal criteria rather than customer input, and customers not knowing what IT can offer. Introduced in Section 3.4 as the fundamental problem that Services and Products strategy must solve.

COBIT (Control Objectives for Information and Related Technologies) An enterprise IT governance and management framework originally developed for audit and compliance contexts. COBIT is comprehensive but designed for large organizations with significant governance infrastructure. Referenced in the Foreword and Section 3.3 as an example of a framework too complex for most local government IT organizations to implement wholesale.

Digital Counties Survey An annual survey conducted by the Center for Digital Government that recognizes counties for effective use of technology to improve government services and operations. Referenced in the Foreword as a measure of IT leadership effectiveness in the county government context.

IT Economics The discipline of communicating IT costs, value, and investment logic in terms that non-technical executives and elected officials can understand and act on. IT economics is not about implementing full chargeback models; it is about creating transparency regarding cost drivers, technology lifecycle, and the relationship between investment and organizational capability. Introduced in Section 3.5.

IT Governance The structured system for making decisions about IT priorities, investments, and resource allocation in a way that ensures the right people are involved, decisions are transparent, and those who make decisions are accountable for outcomes. IT governance answers what decisions need to be made, who should be involved in making them, and how they will be made. Introduced in Section 3.1.

IT Strategic Plan A multi-year directional document (typically 3–5 years) that translates organizational strategy into IT strategy and provides the roadmap for investment, capability building, and technology evolution. Distinguished from project plans and budget documents in that it reflects where IT is going and why, not just what it is doing next. Introduced in Section 3.2.

NIST Cybersecurity Framework (CSF) A risk-based cybersecurity framework developed by the National Institute of Standards and Technology, organized around six core functions: Govern, Identify, Protect, Detect, Respond, and Recover. (NIST CSF 2.0, released in 2024, added the Govern function to emphasize cybersecurity governance.) Required for agencies pursuing FEMA Homeland

Security grants and recommended as the primary cybersecurity framework for local government IT because it is free, vendor-neutral, outcome-focused, and designed to communicate risk in executive-accessible language. Introduced in Section 3.3.

Order-Taker A characterization of IT's reactive posture when it operates without governance or strategy, simply responding to requests from whoever asks most loudly or most recently. The HPG-IT Framework's goal is to move IT from order-taker to strategic partner through governance, strategic planning, and business relationship management.

Portfolio Management The practice of managing IT's full portfolio of commitments, including the service portfolio, project portfolio, application portfolio, and infrastructure portfolio, as an integrated whole rather than as independent silos. Introduced in Section 4.2 as the discipline that ensures IT resources flow to the highest-value work.

Scenario Planning A strategic tool for working through ambiguity by developing multiple plausible futures and identifying actions that are sound across multiple scenarios, rather than betting on one detailed forecast. Recommended in Section 1.4 as a practical approach to planning in uncertain government environments.

Service Catalog The customer-facing inventory of active IT services, clearly defined with documented service levels and support processes. The service catalog is part of the broader service portfolio and tells customers what services exist, how to request them, and what to expect. Introduced in Section 4.2.

Service Pipeline The set of IT services that are currently in development or planned for future delivery. Part of the service portfolio alongside the active service catalog and the record of retired services. Helps elected officials and department heads understand what is coming and when to expect it. Introduced in Section 4.2.

Service Portfolio The complete inventory of all IT services, including active services (service catalog), services in development (service pipeline), and decommissioned services (historical record). Managing the service portfolio ensures business justification exists for each service and that resources are appropriately allocated. Introduced in Section 4.2.

Shadow IT Technology purchases, implementations, or workarounds that departments execute independently, bypassing IT involvement. Shadow IT typically occurs when customers feel IT is unresponsive, unable to meet their needs, or too slow. It creates security risks, integration challenges, and cost inefficiencies. The HPG-IT Framework addresses shadow IT primarily through better coordination and business relationship management rather than through enforcement. Referenced throughout Module 3 and Module 4.

Strategic Partner The aspirational role of IT in the organization, contrasted with the order-taker posture. As a strategic partner, IT actively shapes how technology can advance the organization's mission, brings ideas and perspectives to the table uninvited, and influences strategy rather than simply executing requests.

Technology Lifecycle The natural progression of technology assets from acquisition through operational use to end-of-life and replacement. Managing technology lifecycle transparently is part of IT budget and economics responsibilities described in Section 3.5, helping executives understand why technology assets require periodic replacement investment.

Total Cost of Ownership (TCO) The full cost of a technology asset or system over its operational life, including acquisition, implementation, ongoing support, licensing, training, and eventual decommissioning. Emphasized in Section 3.5 as the appropriate basis for technology investment decisions, not just initial purchase price.

Service Delivery

Alignment Architecture (Goal Cascading) The structure by which organizational-level goals connect to team goals and individual employee goals so that work at every level advances shared priorities. The HPG-IT Framework recommends building alignment over rigid cascading, allowing teams to determine how best to contribute to organizational goals based on their expertise. Introduced in Section 5.4.

Business Relationship Management (BRM) The discipline of building and maintaining strategic partnerships between IT and the departments and leaders it serves, transforming IT from a reactive service provider into a value creator and trusted advisor that brings ideas first. BRM is fundamentally communication work, the ongoing dialogue that builds shared understanding and shapes how the organization thinks about technology possibilities. In local government organizations, BRM is a responsibility shared by the CIO and all IT managers, not a dedicated role. Introduced in Section 4.5.

Change Management (ITSM) The ITSM process that controls how changes to IT systems and infrastructure are reviewed, approved, tested, and deployed to minimize service disruption. One of the three essential ITSM processes identified in Section 3.3 as necessary for every local government IT organization.

Incident Management The ITSM process focused on restoring normal service operations as quickly as possible following an unplanned service interruption. Incident management prioritizes speed of restoration; root cause investigation is handled separately through problem management. One of the three essential ITSM processes identified in Section 3.3.

IT Service Management (ITSM) The discipline of designing, delivering, managing, and improving IT services in a structured, customer-focused way. The HPG-IT Framework does not advocate implementing the full ITSM library but identifies three foundational processes every local government IT organization needs: incident management, change management, and problem management. Referenced throughout Modules 3 and 4.

ITIL (Information Technology Infrastructure Library) A comprehensive IT service management framework originally developed by the UK government and widely adopted across public and private sectors. ITIL covers dozens of processes

and practices organized around the IT service lifecycle. Referenced in the Foreword and Section 3.3 as a valuable but often overwhelming framework for smaller local government organizations; the HPG-IT approach recommends adopting foundational ITIL concepts rather than full implementation.

Organizational Integration The practice of embedding IT processes, governance requirements, and coordination points directly into existing organizational workflows rather than maintaining them as separate IT-only processes. Introduced in Section 5.2 through the example of embedding IT governance review into the Board of Supervisors agenda preparation process. Organizational integration makes IT processes effective by making them invisible and inevitable.

Problem Management The ITSM process focused on identifying and resolving the root causes of recurring incidents to prevent future service disruptions. Distinguished from incident management, which focuses on restoring service quickly. One of the three essential ITSM processes identified in Section 3.3.

Pulse Survey A short, frequent employee survey (typically 5–10 questions) designed to capture current team sentiment, engagement, and morale without the burden of a full annual engagement survey. Recommended in Section 2.5 as a practical tool for monitoring organizational culture and identifying emerging concerns.

Service Level Agreement (SLA) A formal or informal commitment defining the expected level of service quality, availability, or response time for a given IT service. SLAs create measurable accountability between IT and its customers. Referenced in Sections 2.3 and 4.2.

Continuous Improvement

Continuous Improvement The organizational discipline of systematically and repeatedly examining how things are done, identifying opportunities to do them better, and implementing those improvements in a structured way. Module 5 of the HPG-IT Framework is dedicated to building continuous improvement capability as a sustainable organizational practice rather than a one-time initiative.

Feedback Loop A structured mechanism for gathering information about performance, outcomes, or experience and using that information to adjust behavior, processes, or services. Feedback loops are described throughout Module 5 as the foundational tool of continuous improvement and organizational learning.

Innovation Leadership The leadership discipline of creating the organizational conditions, culture, and processes that enable creative problem-solving and technology adoption to emerge from the team rather than being dependent on individual breakthrough ideas. Introduced in Section 5.5 as an everyone-contributes model, not an elite innovation team model.

Organizational Maturity The degree to which an organization's practices, processes, and capabilities are defined, consistent, measured, and continuously improving. The HPG-IT Framework uses organizational maturity as a way to

describe where an IT department is on its development journey and where it is heading. Higher maturity organizations operate more predictably, adapt more effectively, and deliver more consistent value.

Performance Management The system of goal-setting, feedback, measurement, recognition, and accountability that connects individual employee work to organizational priorities. In the HPG-IT context, performance management is treated as a tool for development and coordination, not primarily an administrative or disciplinary process. Introduced in detail in Section 5.4.

Frameworks Referenced

HPG-IT Framework (High-Performing Government IT) The five-module leadership framework developed specifically for CIOs and IT leaders in local government organizations serving populations under 500,000 with IT teams under 150 staff. The five modules are: Being a Government IT Leader (Module 1), Building a Healthy Organization (Module 2), Working on the Right Stuff (Module 3), Delivering Great Service (Module 4), and Continuously Improving (Module 5).

MOF (Microsoft Operations Framework) A service management framework designed by Microsoft for enterprise IT environments. Referenced in the Foreword as an example of a framework designed for large private-sector organizations that does not translate well to smaller local government contexts.

NIST (National Institute of Standards and Technology) A U.S. federal agency that produces technology standards and frameworks, including the NIST Cybersecurity Framework widely used by government organizations. See also: NIST Cybersecurity Framework (CSF).

This glossary reflects terminology as used within the HPG-IT Framework. Some terms have broader definitions in academic or private-sector contexts; the definitions here reflect their specific application to local government IT leadership organizations serving populations under 500,000 with teams under 150 staff.

ACRONYM QUICK REFERENCE

AI: Artificial Intelligence

BRM: Business Relationship Management

CAO: Chief Administrative Officer

CCISDA: California County Information Services Directors Association

CEO: Chief Executive Officer

CES: Customer Effort Score

CFO: Chief Financial Officer

CGCIO: Certified Government Chief Information Officer

CGEIT: Certified in the Governance of Enterprise IT

CIO: Chief Information Officer

CISA: Certified Information Systems Auditor

COBIT: Control Objectives for Information and Related Technologies

CRISC: Certified in Risk and Information Systems Control

CSAC: California State Association of Counties

CSAT: Customer Satisfaction (Score)

CSF: Cybersecurity Framework (see NIST CSF)

DMBOK: Data Management Body of Knowledge

ERP: Enterprise Resource Planning

FCR: First Contact Resolution

FEMA: Federal Emergency Management Agency

FTE: Full-Time Equivalent

FY: Fiscal Year

GIS: Geographic Information Systems

GMIS: Government Management Information Sciences

GRC: Governance, Risk, and Compliance

HDI: Help Desk Institute (now ThinkHDI)

HIPAA: Health Insurance Portability and Accountability Act

HPG-IT: High-Performing Government IT (Framework)

HR: Human Resources

ICMA: International City/County Management Association

ISACA: Information Systems Audit and Control Association

IT: Information Technology

IoT: Internet of Things

ITGI: IT Governance Institute

ITIL: Information Technology Infrastructure Library

ITSM: IT Service Management

KPI: Key Performance Indicator

LMS: Learning Management System

MIX: Metropolitan Information Exchange

MOF: Microsoft Operations Framework

NACo: National Association of Counties

NASCIO: National Association of State Chief Information Officers

NIST: National Institute of Standards and Technology

NIST CSF: NIST Cybersecurity Framework

NPS: Net Promoter Score

OKR: Objectives and Key Results

PMO: Project Management Office

PPM: Project Portfolio Management

PTI: Public Technology Institute

RACI: Responsible, Accountable, Consulted, Informed (Matrix)

RCRC: Rural County Representatives of California

ROI: Return on Investment

SAN: Storage Area Network

SIEM: Security Information and Event Management

SKMS: Service Knowledge Management System

SLA: Service Level Agreement

SSO: Single Sign-On

TCO: Total Cost of Ownership

TOGAF: The Open Group Architecture Framework

WAN: Wide Area Network

ABOUT THE AUTHOR

Steve Monaghan advises and teaches local government IT leaders and works on public-sector AI. He runs LGOV LLC and serves as an Executive Counselor with Info-Tech Research Group.

He spent twenty-five years in California local government, doing the work from the inside. During that career he served concurrently as an agency director, chief information officer, emergency services director, and procurement officer, the same several hats his readers wear. His focus, then and now, is the part of the field that big-city, state, and academic voices overlook: the small and under-resourced majority among America's roughly 90,000 local governments, the counties, cities, towns, special districts, and school districts where budgets are tight and teams are small.

What set his work apart wasn't a bigger team or a newer technology stack. It was a system for running IT that covered the areas that actually mattered. That system became the HPG-IT Framework (High-Performing Government IT), and it became this book. His IT organization earned recognition beyond its size: twenty consecutive years in the Digital Counties Survey top five, six of them at number one, California's CIO of the Year, and a place among the GovTech Top 25 Doers, Dreamers & Drivers.

His peer network runs deep. He has been a member of the California County Information Services Directors Association (CCISDA) for twenty-five years, including five years on its board, and he developed and taught the CSAC/CCISDA County Technology Executive credential program, training several hundred IT leaders over the past decade. Twenty years in MIX, the Metropolitan Information Exchange, including eight on its board, showed him what separates high-performing IT organizations from the ones that struggle. Twelve years in GMIS and ongoing work with NACo, RCRC, ICMA, and CSAC extended that network nationwide.

Today he teaches through the CSAC Institute for Excellence in County Government and LA County's Executive Leadership Development Program, with courses on artificial intelligence, strategy and execution, organizational maturity, and IT leadership. He mentors and coaches local government CIOs through the ISACA

mentorship program, and he contributes to Government Technology publications on leading IT in under-resourced local government.

He serves on the advisory board of Ladris, a govtech company whose AI helps communities model evacuations and respond to wildfires and floods in real time. The work draws on his years as an emergency services director.

Steve holds a bachelor's degree in Computer Science with a minor in Business Administration, along with the Certified Government Chief Information Officer (CGCIO), Certified in the Governance of Enterprise IT (CGEIT), Certified in Risk and Information Systems Control (CRISC), and Certified Information Systems Auditor (CISA) credentials.

He lives in the Sierra Nevada foothills of Northern California, local government country, where city halls are smaller and IT teams run leaner, and he rides his mountain bike there most weeks.
