Indicator Pack

Member Guide

Install • Use • Settings • Renew

GlobalTraderClub.com

Welcome

At GlobalTraderClub, our approach is built on a simple idea: markets move in rhythms of time as well as price. Certain days and certain hours carry more weight than others, and when the right time lines up with the right price level, that is where the best opportunities tend to appear. These tools are built to support exactly that way of trading. They mark the price levels that matter — support and resistance, demand and supply, the busy zones and the key daily levels — so that when one of your important days or hours arrives, you already know the prices to watch. In short: the calendar tells you when to pay attention, and these tools tell you where. Used together, they help you act with a plan instead of guessing.

Thank you for joining GlobalTraderClub. Your pack gives you five chart tools and five ready-made chart layouts, built to work together. This guide walks you through installing them, using each one in your trading, adjusting the settings, and renewing when the time comes.

Please read the **Your Licence** and **Risk Warning** sections. They matter.

What is in your pack

Five tools

- **GTC-TSM** — A tool that sits in its own panel below your chart. It shows the market's push and pull, with trend lines, target levels and buy/sell markers, defining the price levels.
- **GTC-TL** — Draws trend lines, channels, key break levels and target lines directly on your price chart, updated automatically.
- **GTC-MVL** — Shows the price areas where the most volume activity has taken place — the levels the market keeps coming back to.
- **GTC-DAS** — Marks demand and supply areas (where price is likely to react) and highlights price gaps left behind by fast moves. The often cause and consequence called zones.
- **GTC Levels & News** — Plots the key prior day, week and month levels, marks each new day, and flags upcoming economic news and holidays.

Five chart layouts (templates)

Each layout loads the right tools for a timeframe, already set up. One click and your chart is ready:

GTC Monthly • GTC Weekly • GTC Daily • GTC 4H • GTC STF (1 hour and lower) • Clean
(as a reset if you want to design the chart yourself)

What you received

When you joined, you were given two things. You need both.

Setting	What it does
The pack (a ZIP file)	The software — the five tools and five layouts. This is the same for every member and you only ever download it once.
Your key file	A small file named gtc_key.txt. This is yours alone. It unlocks the tools on your account and sets how long your membership runs. Without it, the tools will not draw.
Keep your key file. If you change computer or reinstall, you will need it again. If you ever lose it, just contact us and we will send a new one.	

Installing the pack

This takes a few minutes and you only do it once. Take it one step at a time.

Step 1 — Install the tools

1. Unzip the pack somewhere easy to find, like your Desktop.
2. In MetaTrader 5, click **File** then **Open Data Folder**.
3. Open the **ML5** folder, then the **Indicators** folder.
4. Copy the five tool files from the pack into that folder.
5. Close MetaTrader 5 completely, then open it again.

Step 2 — Install the layouts

1. Click **File** then **Open Data Folder** again.
2. Open **ML5**, then **Profiles**, then **Templates**.
3. Copy the five layout files from the pack into that folder.
4. Close MetaTrader 5 and open it again.

Step 3 — Add your key

This is the step that switches everything on.

1. Click **File** then **Open Data Folder**.
2. Go up one level to the **Terminal** folder, then open **Common**, then **Files**.
3. Create a folder named **GTC** if it is not already there, and open it.
4. Copy your **gtc_key.txt** file into that GTC folder.

Full path: Terminal ► Common ► Files ► GTC ► gtc_key.txt

Step 4 — Put it on a chart

1. Open a chart for the market you want to trade.
2. Set the chart timeframe to match the layout you want (for example, set the chart to Daily before using the GTC Daily layout).
3. Right-click the chart, choose **Templates**, and pick your GTC layout.
4. The tools load, ready to go. You can open as many charts, markets and timeframes as you like.

Checking it worked

The tools should draw on the chart with no red message. You can confirm your membership date at any time: look at the **Toolbox** panel at the bottom of MetaTrader, on the **Experts** tab. You will see a line like:

GTC licence OK - expires 2026.10.15 12:30

Making the layouts your own

The five GTC layouts are a starting point, not a cage. Every tool is independent, so you can run any combination you like, add or remove tools freely, and save your own layouts for the way you trade.

Add, remove or adjust a tool

- **Add a tool:** open the Navigator panel (press Ctrl+N), find the GTC tool under Indicators, and drag it onto the chart.
- **Remove a tool:** right-click the chart, choose Indicators List, select the tool, and click Delete.
- **Adjust a tool:** right-click the chart, choose Indicators List, select the tool, click Properties, and change its settings (see each tool's settings section in this guide).

Save your own layout

- Set a chart up exactly how you want it, then right-click the chart and choose Template, then Save Template. Give it a name you will recognise, such as My Scalping Setup.
- To use it again, right-click any chart, choose Template, and pick your saved layout.

Manage your layouts

- Your saved layouts sit alongside the GTC ones in the Template menu.
- To delete one you no longer want, right-click a chart, choose Template, then Remove Template — or delete the .tpl file from your Templates folder (File then Open Data Folder, then MQL5, Profiles, Templates).
- The Clean Chart layout is there whenever you want a blank canvas to build from: apply it, then add just the GTC tools you want.

A tip: keep the original five GTC layouts as they are, and save your custom setups under new names. That way you always have the defaults to fall back on.

USING THE TOOLS

Each tool is described the same way: what it shows you, how to use it in your trading, and what its settings do. You do not need to understand the maths behind any of it — just what it shows and how to act on it.

GTC-TSM — Momentum

What it shows

GTC-TSM sits in its own panel below your price chart. It shows the strength and direction of the market's momentum — whether buyers or sellers are in control, and how strongly. It draws its own trend lines, target levels and buy/sell markers inside that panel, and can mirror key levels onto the price chart above.

How to use it in your trading

- Use it for your trading and your targeting levels. When price breaks a level or comes to a level on the TSM lines, check the price chart. If the TSM price levels correspond to trade hours and/or trade/swing days according to your bias, the market will either bounce off the line or break out.
- Watch the markers. A buy or sell marker flags the moment momentum turns — a cue to look for an entry in that direction, not an instruction to trade blindly.

- Watch the target lines. They project where the current move may be heading, useful for setting a realistic profit target.
- Best used together with your levels tools — momentum tells you the push; the levels tell you where it is likely to matter.

Its settings

Setting	What it does
Momentum sensitivity	How reactive the tool is. Lower reacts faster (more signals, more noise); higher is smoother (fewer, steadier signals). Default 10 suits most trading.
Bars to display	How much history the panel draws. 0 shows everything. Fewer bars keep the panel clean.
Pivot sensitivity	How pronounced a swing must be before a trend line anchors to it. Higher only picks the bigger turns.
Trend steps / Steps back / Projection bar	Fine controls for how the trend and target lines are drawn and projected forward. The defaults work well; adjust only if you want to experiment.
Show trend lines / break levels / channel lines / target lines	Turn each type of drawing on or off, so you only see what you use.
Show TSM signals	Turn the buy/sell markers on or off.
Mirror lines on price chart	Also draw the key levels up on the price chart, so you can see them against candles.
Show comment panel	Show a small text summary on the chart. Off by default.
Direction	Show markers for both directions, up only, or down only — handy if you only trade one way.
Signal detection lookback bars	How far back the tool looks when deciding a signal. Default is fine for most.
Enable alerts	Pop up an alert when a new signal appears.
Colours	Set the colours for the lines, markers and panel to your taste.

GTC-TL — Trend Lines

What it shows

GTC-TL draws directly on your price chart: automatic trend lines, channels, the levels where price would break structure, and projected target lines. It keeps them updated as new candles form, so you always have a clean read of the current structure without drawing anything by hand.

How to use it in your trading

- Read the structure at a glance. The trend and channel lines show the direction and the boundaries price is respecting.
- Watch the break levels. A close beyond one is an early sign the current structure is shifting.
- Use the target lines to judge how much room a move has before the next likely reaction.

- Use the **Trend Lines: On / Off** button (bottom-left of the chart) to hide everything instantly when you want a clean chart, and bring it back with one click.

Its settings

Setting	What it does
Bars to analyse	How much history the tool considers. 0 uses everything.
Pivot sensitivity	How significant a swing must be before a line anchors to it. Higher picks only the major turns.
Trend line steps / Steps back / Projection bar	Control how many lines are drawn and how far forward they project. Defaults are a good starting point.
Show trend lines / break levels / channel lines / target lines	Turn each drawing type on or off individually.
Show comment panel	A small on-chart text summary. Off by default.
Direction	Draw for both directions, or only up, or only down.
Colours	Set the colour of each line type.

GTC-MVL — Activity Levels

What it shows

GTC-MVL highlights the price areas where the market has been most active — the levels where the most trading took place over recent days, weeks and months. These are the prices the market tends to remember and return to. It can show a full activity profile or a simpler set of key lines.

How to use it in your trading

- Treat the busiest levels as magnets and as decision points — price often reacts when it reaches them.
- A level that has not yet been revisited (highlighted separately) is often an unfinished piece of business the market may come back to fill.
- Use these levels to place targets and to judge where a move might stall or reverse.
- Use the button (bottom-left) to switch between the full profile view, a simpler view, and **Off**.

Its settings

Setting	What it does
How many periods back to show	How many recent days/weeks/months of activity to draw.
Day start hour	The hour your trading day begins, so the daily levels line up with your session.
Main activity band %	How much of the activity counts as the main area around each busy level. 80% is the common choice.
Tick size in pips	Keep at the default unless advised; it controls how finely the activity is measured.
Extended lines	How many of the busiest levels to carry forward across the chart.

Setting	What it does
Display toggles	Show or hide the profile shading, the main activity band, the boundary lines and the open/close markers.
Design & colours	Set every colour and the size of the profile to your taste.
Profile source timeframes	Advanced. Controls how finely each daily/weekly/monthly profile is built. The defaults are well chosen — leave them unless you know you want a change.
Show daily / weekly / monthly lines	Choose which of the three sets of levels appear. 'Auto' picks sensible ones for the chart timeframe you are on.

GTC-DAS — Demand & Supply

What it shows

GTC-DAS marks demand areas (where buyers stepped in strongly) and supply areas (where sellers did), by finding a pause followed by a sharp move away. Demand areas are shaded green, supply red. It also highlights price gaps — bands the market jumped through quickly and often returns to fill. As price comes back to an area, the tool grades it and fades its colour, so you can see which areas are still fresh and which have already been used up.

How to use it in your trading

- Look to buy near fresh demand and sell near fresh supply — a fresh, brightly-coloured area is one price has not yet returned to.
- Watch the fade. As price tests an area it greys down; a greyed area is weaker and more likely to give way.
- Use the **action arrows** on fresh areas as a prompt to look for an entry — an up arrow at demand, a down arrow at supply.
- The highlighted price gaps often act as targets — price frequently travels back to fill them.
- A low-quality area only appears when price is actually inside it, as a dotted grey box — a heads-up that you are in a weak level, not a level worth trading on its own.

Its settings

There are many settings here because the tool is powerful. You can trade happily on the defaults — adjust these only when you want to tune what it shows.

Setting	What it does
Bars to scan for zones	How far back the tool looks for areas.
Base size settings	How tight the pause must be to count as a proper area. Defaults follow the classic rule.
Min impulse size	How strong the move away must be for an area to qualify. Higher = only the strongest areas.
Require open space	Only keep areas that have clear room to run toward a target. Keeps the chart to high-value setups.
Hide low-quality zones	By default, weak areas show only when price is inside them. Turn this

Setting	What it does
	on to hide them completely.
Reject zones wider than...	Ignore over-large areas that are too wide to trade cleanly.
Volume filter settings	Require strong participation behind the move that formed an area, and make stronger areas draw with a thicker border.
Penetration rules	Set how deeply price must enter an area before it is graded down, and whether to hide fully-used and flipped areas.
Only draw fresh + high-prob zones	Show only the cleanest, least-tested areas.
Visuals / colours	Set the colours for fresh, part-used and used-up demand and supply areas.
Merging	Combine areas that heavily overlap into one, for a tidier chart.
Fill / border / extend	Control whether areas are filled or outlined, the border thickness, and how far right they extend.
Labels	Show or hide the small tag on each area, and set its colour and size.
Action arrows	Turn the buy/sell arrows on fresh areas on or off, and set their colour, size and position.
Alerts	Optionally alert when a new area forms or when price reaches one. All off by default.

GTC Levels & News

What it shows

This tool plots the key reference levels every trader watches: the previous day's high, low and close; today's open; and the previous week's and month's highs and lows. It marks the start of each new day with a divider and name, and flags upcoming economic news events and market holidays so you are never caught out by a release.

How to use it in your trading

- Use the prior-day and prior-week levels as natural targets and reaction points — the market watches them closely.
- Today's open tells you at a glance whether the session is trading higher or lower than it began.
- Check the news flags before you trade. High-impact events can move the market sharply; many traders stand aside around them.
- The day dividers make it easy to see how each session behaved on its own.

Its settings

Setting	What it does
How far lines extend	How far past the latest candle each level line is drawn.

Setting	What it does
Show line labels / append price	Show the short name on each line (like PDH for previous day high), and optionally the price too.
Label font / size	Style the labels to your taste.
Each level (Show / colour / style / width)	For every level — previous day high/low/close, today's open, previous week and month highs/lows — turn it on or off and set its colour, line style and thickness.
Day dividers & names	Show or hide the lines that mark each new day, and their colour and style. Choose how many days ahead to project.
News & holidays	Show or hide news and holiday flags, and filter them by importance so you only see what matters. Set the colours for high, medium and low-impact events.

Your Licence

How it works, in plain terms

Your key file does two things. It locks the tools to your trading account, and it sets the date your membership runs until. The first time you load a tool, it quietly reads the account you are logged in to and ties itself to that account. There is nothing to type in.

You can run the tools on as many charts, markets and timeframes as you like — all at the same time — as long as they are on that account.

When your membership is ending

When your key's date passes, the tools stop drawing and show a red message pointing you to renew. Nothing is broken — a new key brings everything straight back.

Permitted use

Your membership is for your own personal use, on your own trading account. Please do not share, copy, resell or pass on the pack or your key file. Doing so ends your membership without refund.

Renewing

Renewing is quick, and you never re-download the software — you already have it. Only your key needs refreshing.

1. Make your renewal purchase at globaltraderclub.com.
2. Let us know you have renewed (or, once automatic renewals are live, this happens for you).
3. We send you a new key file.
4. Replace your old **gtc_key.txt** with the new one, in the same GTC folder as before.
5. That's it — the tools pick up the new date immediately. You may need to remove and re-add a tool, or reopen the chart, for it to refresh.

Changing broker or account? Your key ties to one account. If you move to a new account, contact us and we will issue a key for it. Your old key keeps working on the old account until it expires, so you can keep reviewing your charts there in the meantime.

Common Situations

I changed computer, or reinstalled MetaTrader

Install the pack again on the new machine, log in to the same account, and copy your key file into the GTC folder as before. Everything carries over for the rest of your membership. (This is why keeping your key file safe matters.)

The tools show a red message

Setting	What it does
'licence key not found'	Your key file is not in the right place. Check it sits in Terminal ► Common ► Files ► GTC and is named gtc_key.txt.
'licence key is not valid'	The key file is damaged or incomplete. Ask us for a fresh one.
'licence expired'	Your membership date has passed. Renew and we will send a new key.
'locked to a different account'	You are logged in to a different account from the one your key is for. Log back in to the right account, or contact us if you have switched.

The tools don't appear at all

Close MetaTrader completely and reopen it. If they are still missing, check the five files are in MQL5 ► Indicators.

The layouts aren't in the Templates list

Check the five layout files are in MQL5 ► Profiles ► Templates, then restart MetaTrader.

Risk Warning

Please read this carefully before using these tools.

Trading carries a high risk of loss. Trading foreign exchange, contracts for difference (CFDs), commodities, indices, cryptocurrencies and other leveraged instruments carries a high level of risk and is not suitable for everyone. Leverage can work against you as easily as for you. You may lose some or all of your capital. Never trade with money you cannot afford to lose.

These are analytical tools, not advice. The GlobalTraderClub tools are technical analysis aids. They are not investment advice, not a recommendation, and not an offer or invitation to buy or sell any instrument. They take no account of your personal circumstances, financial position, experience or objectives. GlobalTraderClub is not a licensed financial adviser and does not provide personal advice.

No promise of profit. No representation is made that you will, or are likely to, achieve profits or losses similar to any shown or discussed. Past performance is not a reliable indicator of future results. Any levels, signals, zones or targets shown are estimates only and may be wrong.

Your decisions are your own. You alone are responsible for your trading decisions and their outcome. You should independently verify any level or signal before acting on it. To the fullest extent permitted by law, GlobalTraderClub accepts no liability for any loss or damage — including loss of profit — arising directly or indirectly from use of these tools or reliance on anything they display.

The software may be imperfect. The tools are provided 'as is'. They may contain errors, may not behave as expected, and depend on your broker's price data, server time and platform, which are outside our control. Different brokers may produce different results.

Get advice if you need it. Before trading, consider your objectives, experience and appetite for risk. If you are in any doubt, seek advice from an independent, appropriately licensed financial adviser.

By installing and using this software you confirm that you have read and accepted this risk warning and the permitted-use terms in this guide.

Support

Questions, renewals, a new key, or help after changing broker or computer — we are here.

GlobalTraderClub.com

When you contact us about a problem, a screenshot of your chart and of the Experts tab (in the Toolbox panel) usually lets us help you straight away.
