Inventory caveat: Clinic-West

Author: Aisha Rahman (IT) with Engineering comments **As of:** 2027-02-01 **Status:** incomplete

What we know

- Clinic-West is a leftover clinic site stack from an older acquisition.
- CMDB rows for Clinic-West hosts are **incomplete**. Some hosts have no named application owner.
- At least **two** reachable hosts have **standing local administrator** accounts (not just break-glass, not rotated to the central IdP).
- A 2026 memo used **sunset** language. No completed decommission is on record.
- Clinic scheduling metrics suggest on the order of **12% of appointments** still traverse a path that *appears* to include Clinic-West components. This is an operations estimate, not a closed architecture review.

What we do not know

- Whether every Clinic-West host is in the production scheduling path, adjacent, or leftover and unused.
- A complete host list.
- Whether standing local admin is used daily, rarely, or only as a historical leftover.
- Whether centralized logging, if funded, would see those hosts on day one.

What this is not

This caveat is not a completed production-path diagram. It is not proof that Clinic-West is harmless. It is not proof that Clinic-West is the primary production platform.

Implications for other work (facts, not a portfolio)

Logging coverage statements that include "all production" would be **overstated** until Clinic-West hosts are identified and owned. Logging on **confirmed** clinic-ops production and portal systems does not require a full Clinic-West replacement first.

A scoped effort to confirm production-path status, freeze standing local admin, network-restrict leftover hosts, and name owners is a different size of work from replacing Clinic-West.
