

Prompt from Demo Video: Google Search + Canvas

I am an e-commerce skincare brand owner preparing to launch a new organic face serum and I need to figure out our ideal retail price.

Build an interactive product pricing optimization tool inside this workspace. Include manual input fields for our main costs: Manufacturing Cost per Unit, Packaging Cost per Unit, and Average Shipping Cost per Unit. Based on those inputs, calculate the total landed cost and display a big, clear recommendation for our retail price using a standard 70% gross profit margin. Finally, include interactive sliders for 'Customer Discount Percentage' (like a 15% off launch sale) and 'Ad Spend per Acquisition' so I can visualize exactly how promotions and marketing costs will impact our actual take-home net profit per bottle before we launch.
